16.36: Communication Systems Engineering

Lecture 3: Measuring Information and Entropy

February 10, 2009
Eytan Modiano

Information content of a random variable (how much information is in the data?)

- **Random variable X**
 - Outcome of a random experiment
 - Discrete R.V. takes on values from a finite set of possible outcomes
PMF: $P(X = y) = P_x(y)$
- **How much information is contained in the event $X = y$?**
 - **Will the sun rise today?**

Revealing the outcome of this experiment provides no information
 - **Will the Celtics win the NBA championship?**

It's possible - but not certain
Revealing the answer to this question certainly has value - I.e., contains information
- **Events whose outcome is certain contain less information than even whose outcome is in doubt**

Measure of Information

- $I(x_i)$ = Amount of information revealed by an outcome $X = x_i$
- Desirable properties of $I(x)$:
 1. If $P(x) = 1$ or $P(x) = 0$, then $I(x) = 0$
 2. If $0 < P(x) < 1$, then $I(x) > 0$
 3. If $P(x) < P(y)$, then $I(x) > I(y)$
 4. If x and y are independent events then $I(x,y) = I(x)+I(y)$
- Above is satisfied by: $I(x) = \text{Log}_2(1/P(x))$
- Base of Log is not critical
 - Base 2 \Rightarrow information measured in bits

Entropy

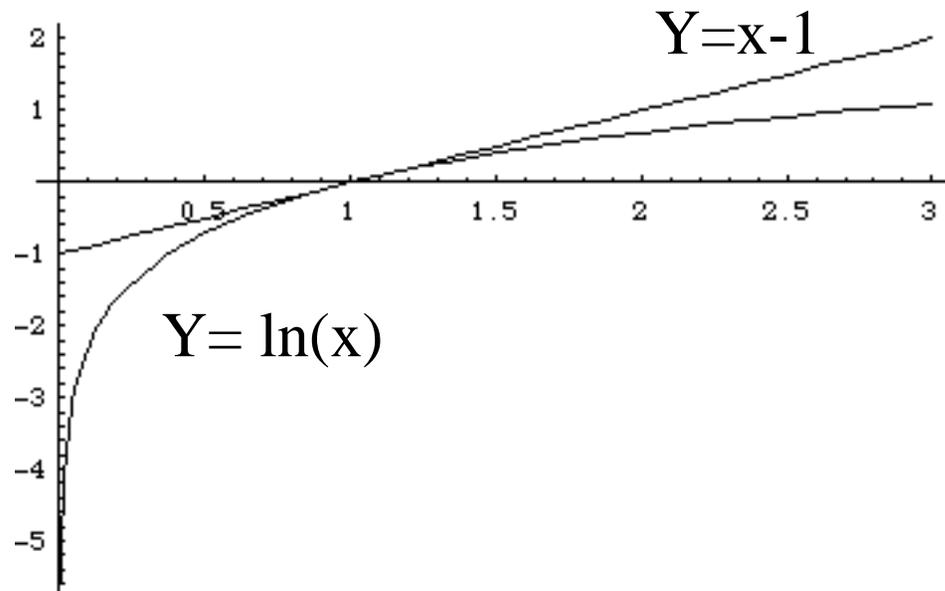

- A measure of the information content of a random variable
- $X \in \{x_1, \dots, x_M\}$
- $H(X) = E[I(X)] = \sum P(x_i) \text{Log}_2(1/P(x_i))$
- **Example: Binary experiment**
 - $X = x_1$ with probability p
 - $X = x_2$ with probability $(1-p)$
 - $H(X) = p\text{Log}_2(1/p) + (1-p)\text{Log}_2(1/(1-p)) = H_b(p)$
 - $H(X)$ is maximized with $p=1/2$, $H_b(1/2) = 1$

Not surprising that the result of a binary experiment can be conveyed using one bit

Simple bounds on entropy

- **Theorem: Given a random variable with M possible values**
 - $0 \leq H(X) \leq \log_2(M)$
 - A) $H(X) = 0$ if and only if $P(x_i) = 1$ for some i
 - B) $H(X) = \log_2(M)$ if and only if $P(x_i) = 1/M$ for all i

- **Proof of A is obvious**
- **Proof of B requires the Log Inequality:**
- **if $x > 0$ then $\ln(x) \leq x-1$**
 - Equality if $x=1$

Proof, continued

Consider the sum $\sum_{i=1}^M P_i \text{Log}\left(\frac{1}{MP_i}\right) = \frac{1}{\ln(2)} \sum_{i=1}^M P_i \text{Ln}\left(\frac{1}{MP_i}\right)$, by log inequality:

$$\leq \frac{1}{\ln(2)} \sum_{i=1}^M P_i \left(\frac{1}{MP_i} - 1\right) = \frac{1}{\ln(2)} \sum_{i=1}^M \left(\frac{1}{M} - P_i\right) = 0, \text{ equality when } P_i = \frac{1}{M}$$

Writing this in another way:

$$\sum_{i=1}^M P_i \text{Log}\left(\frac{1}{MP_i}\right) = \sum_{i=1}^M P_i \text{Log}\left(\frac{1}{P_i}\right) + \sum_{i=1}^M P_i \text{Log}\left(\frac{1}{M}\right) \leq 0, \text{ equality when } P_i = \frac{1}{M}$$

$$\text{That is, } \sum_{i=1}^M P_i \text{Log}\left(\frac{1}{P_i}\right) \leq \sum_{i=1}^M P_i \text{Log}(M) = \text{Log}(M)$$

Joint Entropy

$$\text{Joint entropy: } H(X, Y) = \sum_{x, y} p(x, y) \log\left(\frac{1}{p(x, y)}\right)$$

Conditional entropy: $H(X | Y)$ = uncertainty in X given Y

$$H(X | Y = y) = \sum_x p(x | Y = y) \log\left(\frac{1}{p(x | Y = y)}\right)$$

$$H(X | Y) = E[H(X | Y = y)] = \sum_y p(Y = y) H(X | Y = y)$$

$$H(X | Y) = \sum_{x, y} p(x, y) \log\left(\frac{1}{p(x | Y = y)}\right)$$

In General: X_1, \dots, X_n random variables

$$H(X_n | X_1, \dots, X_{n-1}) = \sum_{x_1, \dots, x_n} p(x_1, \dots, x_n) \log\left(\frac{1}{p(x_n | x_1, \dots, x_{n-1})}\right)$$

Rules for entropy

1. Chain rule:

$$H(X_1, \dots, X_n) = H(X_1) + H(X_2|X_1) + H(X_3|X_2, X_1) + \dots + H(X_n|X_{n-1}, \dots, X_1)$$

2. $H(X, Y) = H(X) + H(Y|X) = H(Y) + H(X|Y)$

3. If X_1, \dots, X_n are independent then:

$$H(X_1, \dots, X_n) = H(X_1) + H(X_2) + \dots + H(X_n)$$

If they are also identically distributed (i.i.d) then:

$$H(X_1, \dots, X_n) = nH(X_1)$$

4. $H(X_1, \dots, X_n) \leq H(X_1) + H(X_2) + \dots + H(X_n)$ (with equality *iff* independent)

Proof: use chain rule and notice that $H(X|Y) < H(X)$
entropy is not increased by additional information

Mutual Information

- **X, Y random variables**
- **Definition: $I(X;Y) = H(Y) - H(Y|X)$**
- **Notice that $H(Y|X) = H(X,Y) - H(X) \Rightarrow I(X;Y) = H(X)+H(Y) - H(X,Y)$**
- **$I(X;Y) = I(Y;X) = H(X) - H(X|Y)$**
- **Note: $I(X,Y) \geq 0$ (equality *iff* independent)**
 - **Because $H(Y) \geq H(Y|X)$**
