2

Outline

- Review
- Analysis
 - Depth-first search
 - Breadth-first search
- Iterative deepening

Brian Williams, Fall 10

3

Autonomous Systems:

- Plan complex sequences of actions
- Schedule tight resources
- Monitor and diagnose behavior
- Repair or reconfigure hardware.

⇒ formulate as state space search.

Brian Williams, Fall 10

4

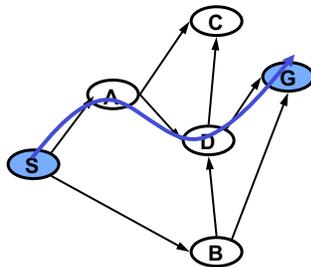

Formalizing Graph Search

Input: A search problem $SP = \langle g, S, G \rangle$ where

- graph $g = \langle V, E \rangle$,
- start vertex S in V , and
- goal vertex G in V .

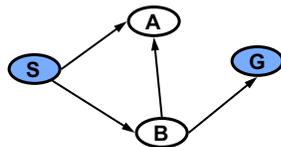

Output: A simple path $P = \langle S, v_2, \dots, G \rangle$ in g from S to G .

(i.e., $\langle v_i, v_{i+1} \rangle \in E$, and $v_i \neq v_j$ if $i \neq j$).

8

Pseudo Code For Simple Search

Let g be a Graph
 S be the Start vertex of g

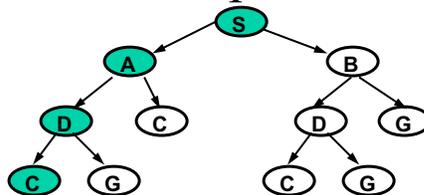

G be the Goal vertex of g .
 Q be a list of simple partial paths in GR,

1. Initialize Q with partial path (S) as only entry; set Visited = ();
2. If Q is empty, fail. Else, pick some partial path N from Q;
3. If head(N) = G, return N; (goal reached!)
4. Else
 - a) Remove N from Q;
 - b) Find all children of head(N) (its neighbors in g) not in Visited and create a one-step extension of N to each child;
 - c) Add to Q all the extended paths;
 - d) Add children of head(N) to Visited;
 - e) Go to step 2.

Brian Williams, Fall 10

9

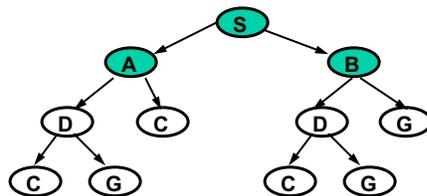

Solution: Depth First Search (DFS)

Depth-first:

Add path extensions to **front** of Q
 Pick first element of Q

Solution: Breadth First Search (BFS)

Breadth-first:

Add path extensions to **back** of Q
 Pick first element of Q

Elements of Algorithm Design

Description: (last Monday)

- Problem statement.
- Stylized pseudo code, sufficient to analyze and implement the algorithm.
- Implementation (last Wednesday).

Analysis: (today)

- Performance:
 - Time complexity:
 - how long does it take to find a solution?
 - Space complexity:
 - how much memory does it need to perform search?
- Correctness: (next Monday)
 - Soundness:
 - when a solution is returned, is it guaranteed to be correct?
 - Completeness:
 - is the algorithm guaranteed to find a solution when there is one?

Performance Analysis

Analysis of run-time and resource usage:

- Helps to understand *scalability*.
- Draws line between *feasible* and *impossible*.
 - A function of program input.
 - Parameterized by input size.
 - Seeks upper bound.

Types of Analyses

Worst-case:

- $T(n)$ = maximum time of algorithm on any input of size n .

Average-case:

- $T(n)$ = expected time of algorithm over all inputs of size n .
 - Requires statistical distribution on inputs.

Best-case:

- $T(n)$ = minimum time of algorithm on any input.

Analysis uses *Machine-independent* Time and Space

Performance depends on computer speed:

- Relative speed (run on same machine)
- Absolute speed (on different machines)

Big idea:

- Ignore machine-dependent constraints
- Look at growth of $T(n)$ as $n \rightarrow \infty$

“Asymptotic Analysis”

Asymptotic notation

O-notation (upper bounds):

- $2n^2 = O(n^3)$
means $2n^2 \leq cn^3$ for *sufficiently large* c & n
- $f(n) = O(g(n))$
if there **exists** constants $c > 0$, $n_0 > 0$
such that $0 \leq f(n) \leq cg(n)$ for all $n \geq n_0$.

Set definition of O-notation

$O(n^3) = \{ \text{all functions bounded by } cn^3 \}$

$2n^2 \in O(n^3)$

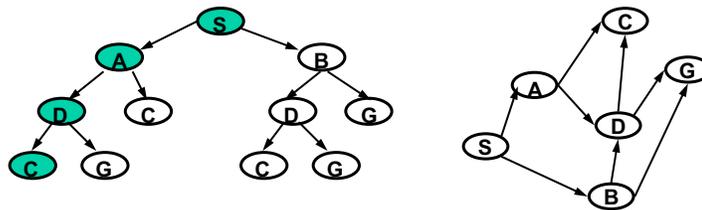

$O(g(n)) = \{f(n) \mid \text{there exists constants } c > 0, n_0 > 0 \text{ such that } 0 \leq f(n) \leq c g(n) \text{ for all } n \geq n_0\}$

Brian Williams, Fall 10

17

Performance and Resource Usage

Which is better, **depth-first** or **breadth-first**?

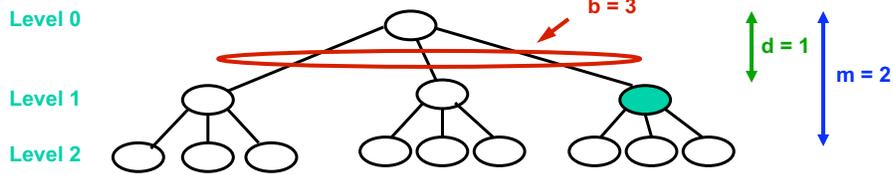

Search Method	Worst Time	Worst Space	Shortest Path?	Guaranteed to find path?
Depth-first				
Breadth-first				

Brian Williams, Fall 10

18

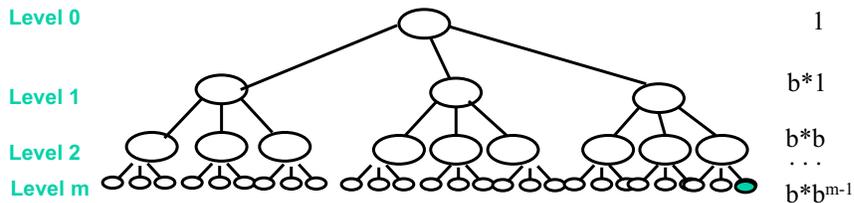

Analyzing Time and Space Complexity of Search in Terms of Trees

b = maximum branching factor, number of children
 d = depth of the shallowest goal node
 m = maximum length of any path in the state space

Worst Case Time for Depth-first

Worst case time T is proportional to number of nodes visited

$$T_{dfs} = [b^0 + \dots + b + 1] * c_{dfs} \quad \text{where } c_{dfs} \text{ is time per node}$$

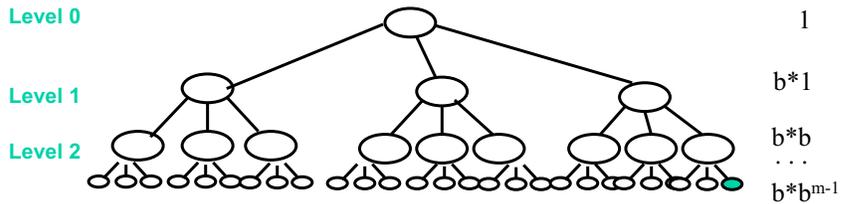

$$b * T_{dfs} = [b^{m+1} + b^m + \dots + b + 0] * c_{dfs} \quad \text{Solve recurrence}$$

$$[b - 1] * T_{dfs} = [b^{m+1} - 1] * c_{dfs}$$

$$T_{dfs} = [b^{m+1} - 1] / [b - 1] * c_{dfs}$$

Cost Using Order Notation

Worst case time T is proportional to number of nodes visited

Order Notation

- $T(n) = O(e(n))$ if $T \leq c \cdot e$ for sufficiently large c & n

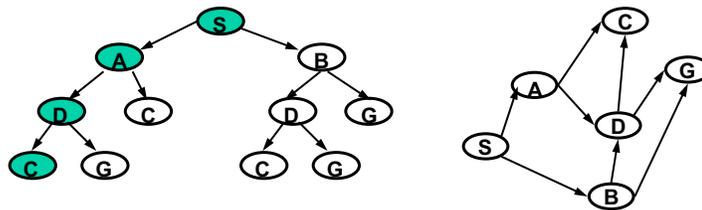

$$T_{dfs} = \frac{[b^{m+1} - 1]}{[b - 1]} \cdot c_{dfs}$$

$$= O(b^{m+1})$$

$$\sim O(b^m) \quad \text{as } b \rightarrow \infty \quad (\text{used in some texts})$$

Performance and Resource Usage

Which is better, depth-first or breadth-first?

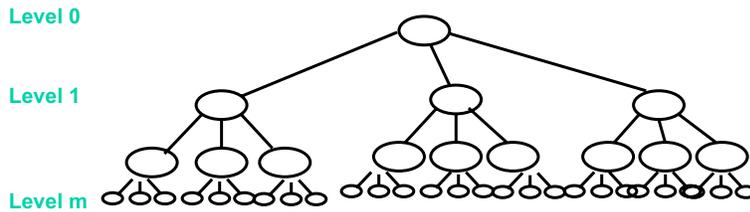

Search Method	Worst Time	Worst Space	Shortest Path?	Guaranteed to find path?
Depth-first	$\sim b^m$			
Breadth-first				

Worst case time is proportional to number of nodes visited
 Worst case space is proportional to maximal length of Q

Worst Case Space for Depth-first

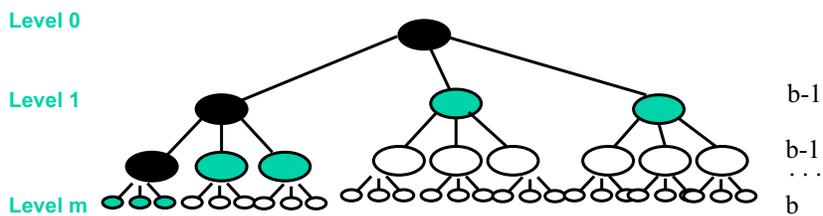

Worst case space S_{dfs} is proportional to maximum length of Q

- If a node is queued its parent and siblings have been queued, and its parent dequeued.

Worst Case Space for Depth-first

Worst case space S_{dfs} is proportional to maximum length of Q

- If a node is queued its parent and siblings have been queued, and its parent dequeued.

$$S_{dfs} \geq [(b-1)*m+1] * c_{dfs} \text{ where } c_{dfs} \text{ is space per node.}$$

- At most one sibling of a node has its children queued.

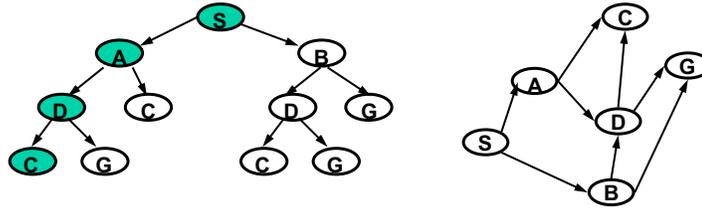

$$\rightarrow S_{dfs} = [(b-1)*m+1] * c_{dfs}$$

- $S_{dfs} = O(b*m)$

+ add visited list

Performance and Resource Usage

Which is better, depth-first or breadth-first?

Search Method	Worst Time	Worst Space	Shortest Path?	Guaranteed to find path?
Depth-first	$\sim b^m$	$b * m$		
Breadth-first				

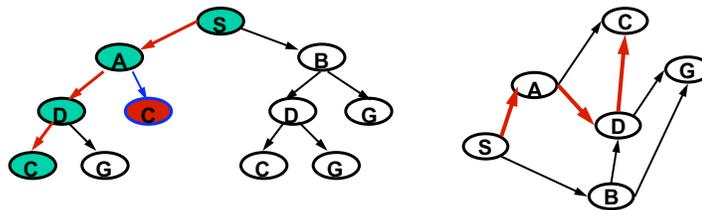

Worst case time is proportional to number of nodes visited
 Worst case space is proportional to maximal length of Q

Brian Williams, Fall 10

25

Performance and Resource Usage

Which is better, depth-first or breadth-first?

Search Method	Worst Time	Worst Space	Shortest Path?	Guaranteed to find path?
Depth-first	$\sim b^m$	$b * m$	No	
Breadth-first				

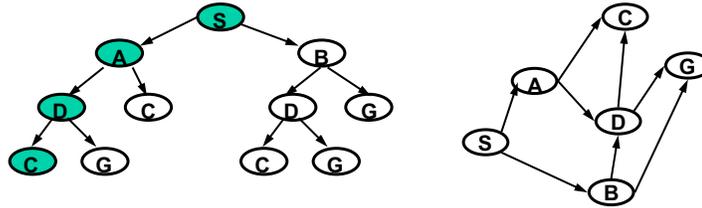

Worst case time is proportional to number of nodes visited
 Worst case space is proportional to maximal length of Q

Brian Williams, Fall 10

26

Performance and Resource Usage

Which is better, depth-first or breadth-first?

Search Method	Worst Time	Worst Space	Shortest Path?	Guaranteed to find path?
Depth-first	$\sim b^m$	$b * m$	No	Yes for finite graph
Breadth-first				

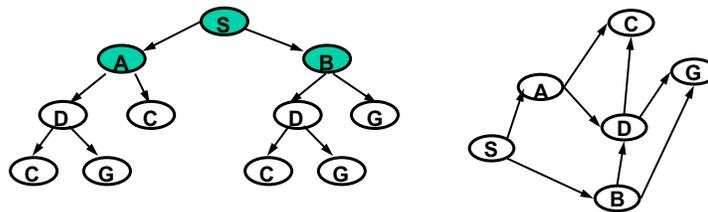

Worst case time is proportional to number of nodes visited
 Worst case space is proportional to maximal length of Q

Brian Williams, Fall 10

27

Performance and Resource Usage

Which is better, depth-first or breadth-first?

Search Method	Worst Time	Worst Space	Shortest Path?	Guaranteed to find path?
Depth-first	$\sim b^m$	$b * m$	No	Yes for finite graph
Breadth-first				

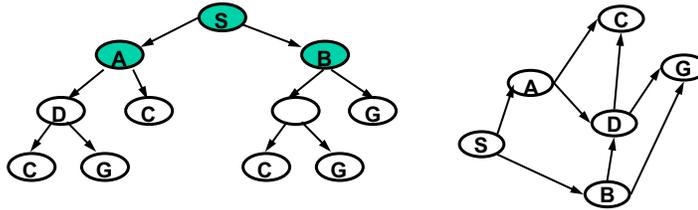

Worst case time is proportional to number of nodes visited
 Worst case space is proportional to maximal length of Q

Brian Williams, Fall 10

28

Performance and Resource Usage

Which is better, depth-first or breadth-first?

Search Method	Worst Time	Worst Space	Shortest Path?	Guaranteed to find path?
Depth-first	$\sim b^m$	$b * m$	No	Yes for finite graph
Breadth-first	$\sim b^{d+1}$			

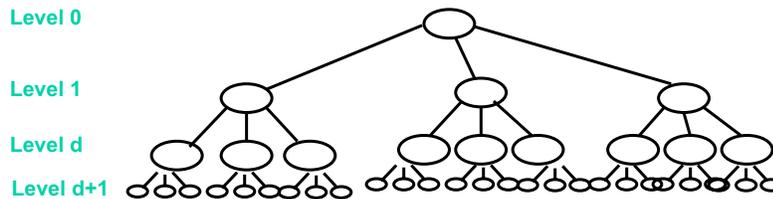

Worst case time is proportional to number of nodes visited
 Worst case space is proportional to maximal length of Q

Brian Williams, Fall 10

31

Worst Case Space for Breadth-first

Worst case space S_{dfs} is proportional to maximum length of Q

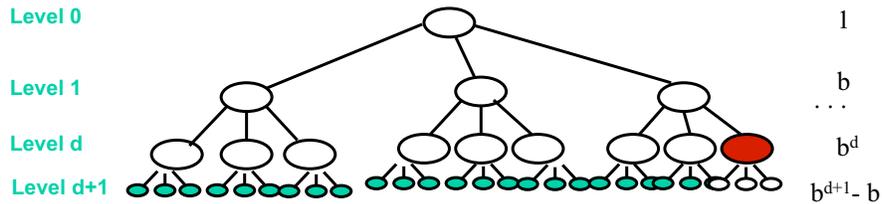

Brian Williams, Fall 10

32

Worst Case Space for Breadth-first

Worst case space S_{dfs} is proportional to maximum length of Q

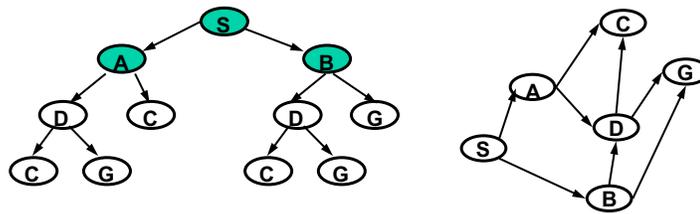

$$S_{bfs} = [b^{d+1} - b + 1] * c_{bfs}$$

$$= O(b^{d+1})$$

Performance and Resource Usage

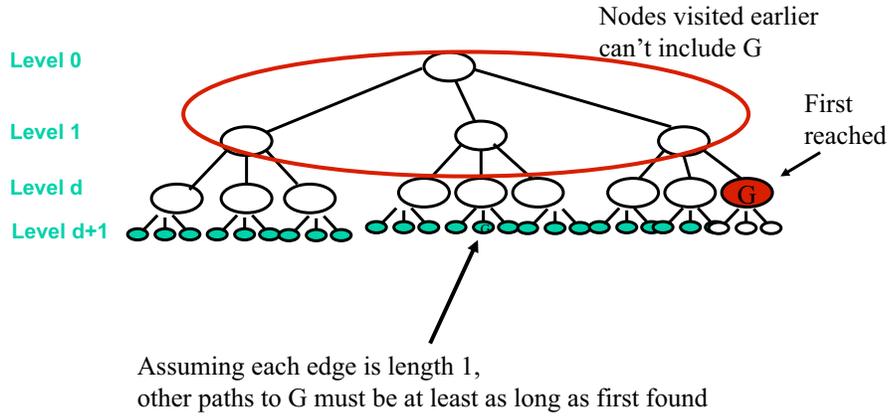

Which is better, depth-first or breadth-first?

Search Method	Worst Time	Worst Space	Shortest Path?	Guaranteed to find path?
Depth-first	$\sim b^m$	$b * m$	No	Yes for finite graph
Breadth-first	$\sim b^{d+1}$	b^{d+1}		

Worst case time is proportional to number of nodes visited
 Worst case space is proportional to maximal length of Q

Breadth-first Finds Shortest Path

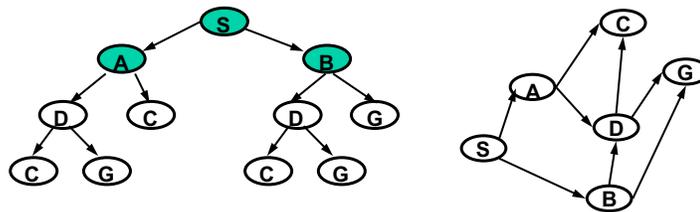

Brian Williams, Fall 10

35

Performance and Resource Usage

Which is better, depth-first or breadth-first?

Search Method	Worst Time	Worst Space	Shortest Path?	Guaranteed to find path?
Depth-first	$\sim b^m$	$b * m$	No	Yes for finite graph
Breadth-first	$\sim b^{d+1}$	b^{d+1}	Yes unit length	

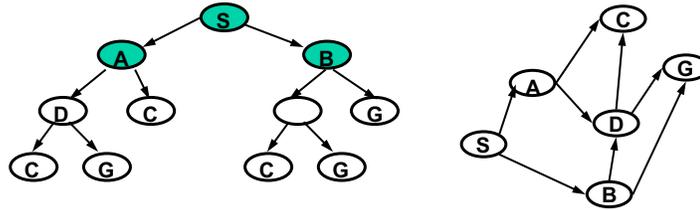

Worst case time is proportional to number of nodes visited
 Worst case space is proportional to maximal length of Q

Brian Williams, Fall 10

36

Performance and Resource Usage

Which is better, depth-first or breadth-first?

Search Method	Worst Time	Worst Space	Shortest Path?	Guaranteed to find path?
Depth-first	$\sim b^m$	b^*m	No	Yes for finite graph
Breadth-first	$\sim b^{d+1}$	b^{d+1}	Yes <small>unit length</small>	Yes

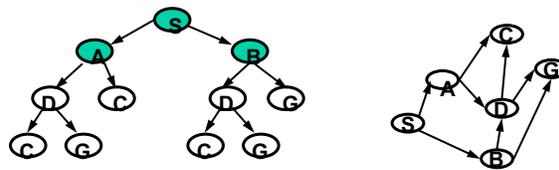

Worst case time is proportional to number of nodes visited
 Worst case space is proportional to maximal length of Q

Brian Williams, Fall 10

37

The Worst of The Worst

Which is better, depth-first or breadth-first?

- Assume $d = m$ in the worst case, and call both m .
- Best-first can't expand to level $m+1$, just m .

Search Method	Worst Time	Worst Space	Shortest Path?	Guaranteed to find path?
Depth-first	$\sim b^m$	b^*m	No	Yes for finite graph
Breadth-first	$\sim b^m$	b^m	Yes <small>unit length</small>	Yes

Worst case time is proportional to number of nodes visited
 Worst case space is proportional to maximal length of Q

Brian Williams, Fall 10

38

For best first search, which runs out first – time or memory?

Growth for Best First Search

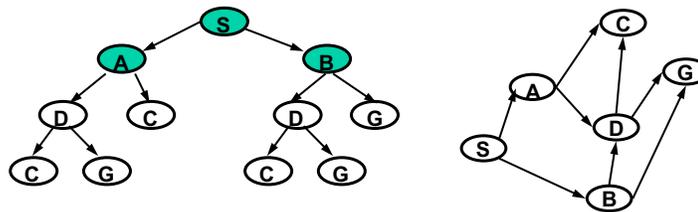

$b = 10$; 10,000 nodes/sec; 1000 bytes/node

Depth	Nodes	Time	Memory
2	1,100	.11 seconds	1 megabyte
4	111,100	11 seconds	106 megabytes
6	10^7	19 minutes	10 gigabytes
8	10^9	31 hours	1 terabyte
10	10^{11}	129 days	101 terabytes
12	10^{13}	35 years	10 petabytes
14	10^{15}	3,523 years	1 exabyte

Brian Williams, Fall 10

39

How Do We Get The Best of Both Worlds?

Search Method	Worst Time	Worst Space	Shortest Path?	Guaranteed to find path?
Depth-first	$\sim b^m$	$b * m$	No	Yes for finite graph
Breadth-first	$\sim b^{d+1}$	b^{d+1}	Yes unit length	Yes

Worst case time is proportional to number of nodes visited
 Worst case space is proportional to maximal length of Q

Brian Williams, Fall 10

40

Outline

- Analysis
- Iterative deepening

Iterative Deepening (IDS)

Idea:

- Explore tree in **breadth-first order**, using **depth-first search**.
- ➔ Search tree to **depth 1**,

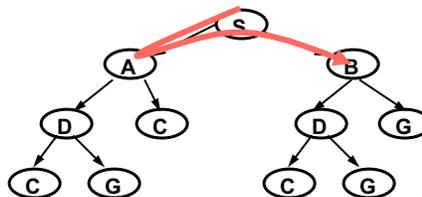

called **depth-limited search**

Level 0

Level 1

Level 2

Level 3

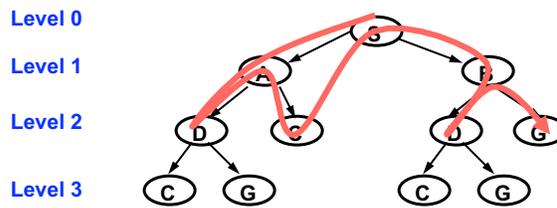

Iterative Deepening (IDS)

Idea:

- Explore tree in **breadth-first order**, using **depth-first search**.
- ➔ Search tree to depth 1, then 2,

called **depth-limited search**

Brian Williams, Fall 10

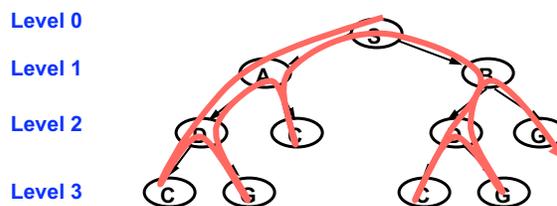

43

Iterative Deepening (IDS)

Idea:

- Explore tree in **breadth-first order**, using **depth-first search**.
- ➔ Search tree to depth 1, then 2, then 3....

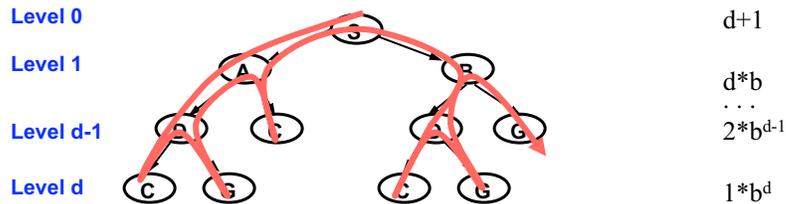

called **depth-limited search**

Brian Williams, Fall 10

44

Speed of Iterative Deepening

Compare speed of BFS vs IDS:

- $T_{\text{bfs}} = 1 + b + b^2 + \dots + b^d + (b^{d+1} - b) \sim O(b^{d+1})$
 - $T_{\text{ids}} = (d + 1)1 + (d)b + (d - 1)b^2 + \dots + 2b^{d-1} + b^d$
 $= [b^{d+2} + d(b-1) + 1] / [b - 1]^2$
 $\sim O(b^d)$ for $\text{lrg } b$
- Iterative deepening **performs better than** breadth-first!

Brian Williams, Fall 10

45

Speed of Iterative Deepening

$$T_{\text{ids}} = (d + 1)1 + (d)b + (d - 1)b^2 + \dots + 2b^{d-1} + b^d$$

$$bT_{\text{ids}} = (d + 1)b + (d)b^2 + (d - 1)b^3 + \dots + 2b^{d+1} + b^{d+1}$$

$$(b-1)T_{\text{ids}} = (d + 1) + b + b^2 + b^3 + \dots + b^d + b^{d+1}$$

$$(b-1)T_{\text{ids}} = d + \{[b^{d+2} + 1] / [b - 1]\}$$

$$= [b^{d+2} + d(b-1) + 1] / [b - 1]^2$$

$$\sim O(b^d) \text{ for } \text{lrg } b$$

→ Iterative deepening **performs better than** breadth-first!

Brian Williams, Fall 10

46

Soundness and Completeness

(next Monday)

Soundness:

- All returned solutions are correct.
- Returns only simple paths from S to G.

Completeness:

- Always returns a solution if one exists.
- Returns a simple path from S to G whenever S is connected to G.

Brian Williams, Fall 10

47

Summary

- Most problem solving tasks may be encoded as state space search.
- Basic data structures for search are graphs and search trees.
- Depth-first and breadth-first search may be framed, as instances of a generic search strategy.
- Cycle detection is required to achieve efficiency and completeness.
- Complexity analysis shows that breadth-first is preferred in terms of optimality and time, while depth-first is preferred in terms of space.
- Iterative deepening draws the best from depth-first and breadth-first search.
