

'Schemas' of memory

Conclusions from schema paper:

- The task is hippocampus dependent.
- Having a schema makes one trial learning possible.
- This one trial learning that was incorporated into a schema is out of the hippocampus in less than 48 hours.
- Incorporating new information into a schema is hippocampus dependent.
- The findings cannot be explained by a procedural strategy.
- The time window for consolidating new information into a schema is between 3 and 48 hours.
- The findings cannot be explained by learning being more rapid because the room became more familiar.
