

**Chemistry 5.12 Spring 2003, Handout #9**  
**Substitution Reactions (S<sub>N</sub>2 versus S<sub>N</sub>1)**

**S<sub>N</sub>2**

**S<sub>N</sub>1**

	<b>S<sub>N</sub>2</b>	<b>S<sub>N</sub>1</b>
<b>Mechanism:</b>	<b>Concerted</b>	<b>Two Steps</b> (Look for carbocation rearrangements.)
<b>Rate Equation:</b>	<b>Rate = k<sub>r</sub>[R-X][Nuc]</b>	<b>Rate = k<sub>r</sub>[R-X]</b>
<b>Stereochemistry:</b>	<b>Stereospecific</b> (inversion)	<b>Loss of Stereochemistry</b>
<b>Substrate:</b>	<b>Sterics</b> (methyl > 1° > 2°) <b>No S<sub>N</sub>2 with 3°!</b> <b>Orbital Overlap</b> (methyl benzylic > allylic > 1°)	<b>Cation Stability</b> (benzylic > allylic > 3° > 2°) <b>No 1° or methyl R<sup>+</sup></b> <b>without extra stabilization!</b>
<b>Nucleophile:</b>	<b>Strong/Moderate Required</b> strong: RS <sup>-</sup> , I <sup>-</sup> , R <sub>2</sub> N <sup>-</sup> , R <sub>2</sub> NH, RO <sup>-</sup> , CN <sup>-</sup> moderate: RSH, Br <sup>-</sup> , RCO <sub>2</sub> <sup>-</sup>	<b>Not Important</b>
<b>Leaving Group:</b>	<b>Moderately Important</b> (same trend as S <sub>N</sub> 1)	<b>Very Important</b> (-OTf >> -OTs -OMs >> -I > -Br > -Cl)
<b>Solvent:</b>	<b>Polar Aprotic</b>	<b>Polar Protic</b>

**Elimination Reactions: E2 versus E1**

**E2**

**E1**

	<b>E2</b>	<b>E1</b>
<b>Mechanism:</b>	<b>Concerted</b>	<b>Two Steps</b> (Look for carbocation rearrangements.)
<b>Rate Equation:</b>	<b>Rate = k<sub>r</sub>[R-X][Base]</b>	<b>Rate = k<sub>r</sub>[R-X]</b>
<b>Stereochemistry:</b>	<b>Stereospecific</b> (antiperiplanar TS)	<b>Not Stereospecific</b>
<b>Substrate:</b>	<b>Alkene Stability</b> (3° > 2° > 1°)	<b>Cation Stability</b> (benzylic > allylic > 3° > 2°)
<b>Base:</b>	<b>Strong Base Required</b> (RO <sup>-</sup> , R <sub>2</sub> N <sup>-</sup> )	<b>Not Important: Usually Weak</b> (ROH, R <sub>2</sub> NH)
<b>Leaving Group:</b>	<b>Moderately Important</b> (same trend as S <sub>N</sub> 1)	<b>Very Important</b> (same trend as S <sub>N</sub> 1)
<b>Solvent:</b>	<b>Wide Range of Solvents</b>	<b>Polar Protic</b>
<b>Product Ratio:</b>	<b>Saytzeff Rule:</b> The most highly substituted alkene usually predominates. <b>Hofmann Product:</b> Use of a sterically hindered base will result in formation of the least substituted alkene (Hofmann product).
