

Problem Set #3
Due: March 3, 4:00 pm

1. Calculate the degree of unsaturation for $C_8H_{10}F_3NO$.

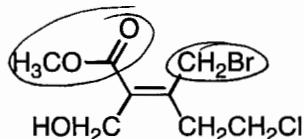

If fully saturated: C_8H_{18}

$$18H - (10H + 3 - 1) = \frac{6H}{2} = 3H_2 = \boxed{3}$$

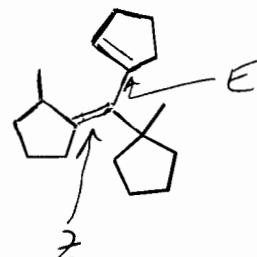

2. Assign *E-Z* configuration to each alkene.

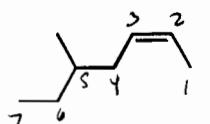

E

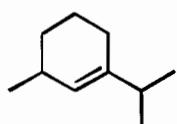

Z

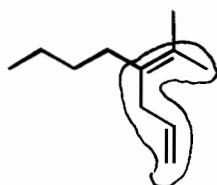

3. Name the following alkenes.

cis - 5-methyl-2-heptene

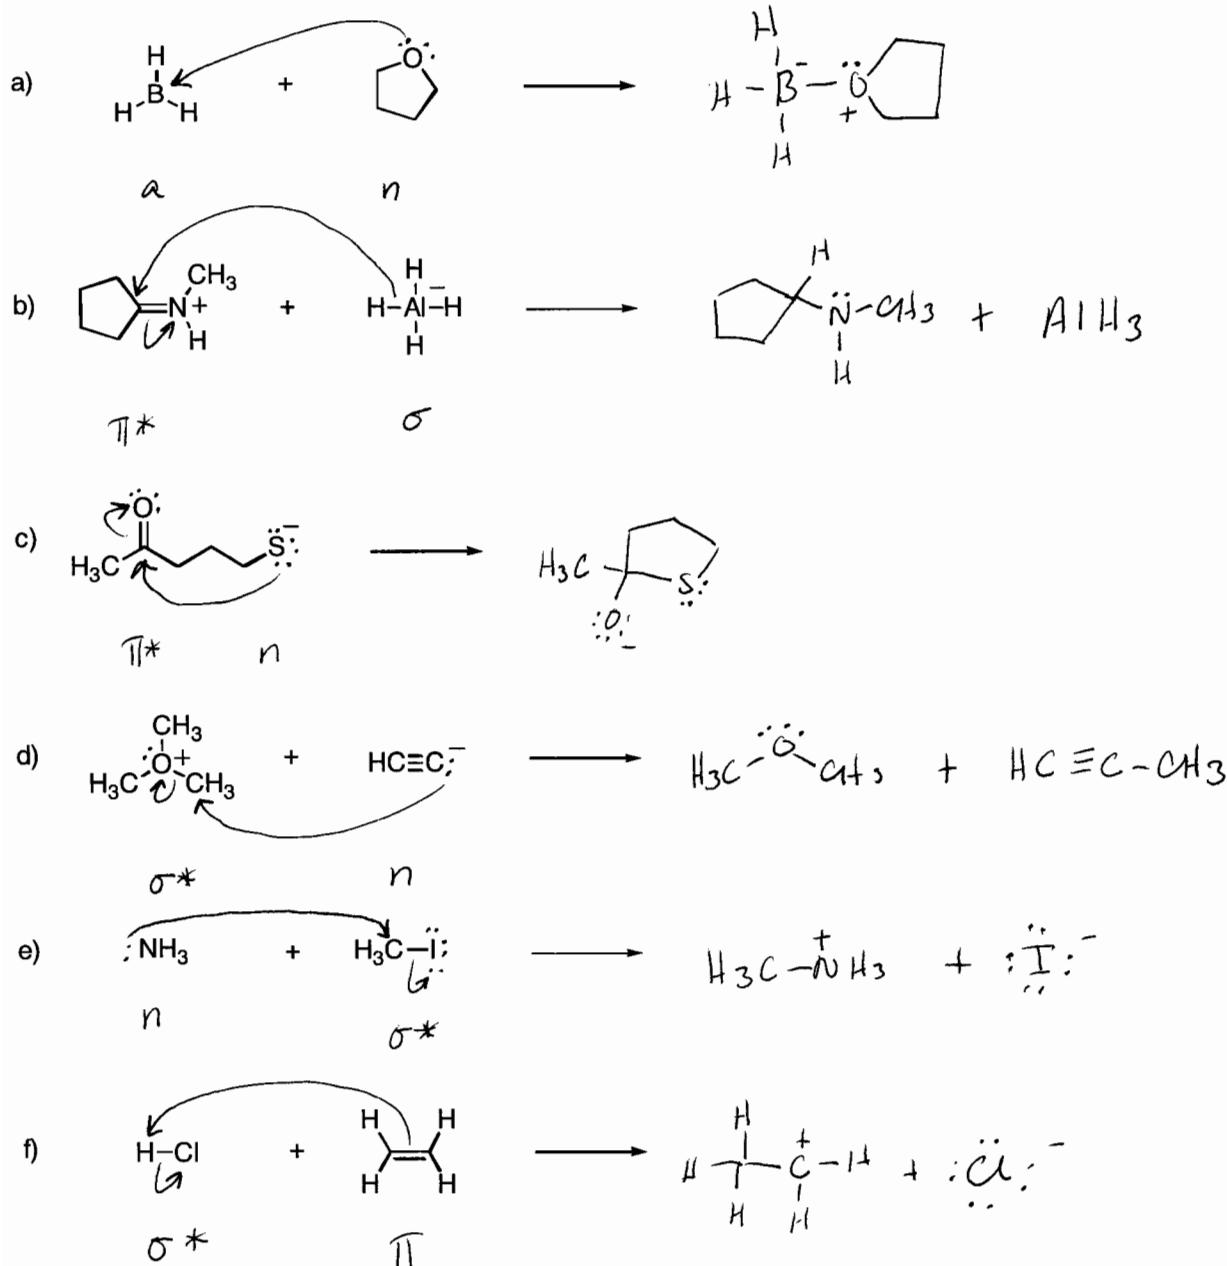

1-isopropyl-3-methylcyclohexene

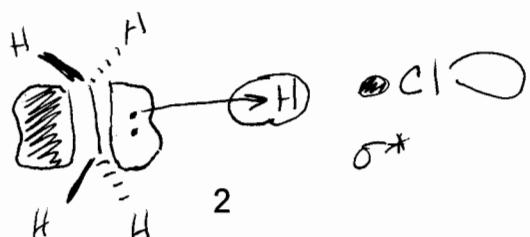

4-butyl-5-methyl-1,4-hexadiene

4. For each of the following reactions, label the type of nucleophile: lone pair (n), pi bond (π), sigma bond (σ), and the type of electrophile: empty atomic orbital (a), polarized pi bond (π^*), polarized sigma bond (σ^*). Draw in all lone pairs and use curved arrows to show how the nucleophile attacks the electrophile and show the product of these one-step reactions.

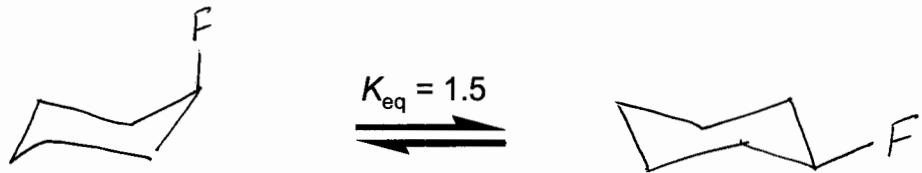

g) Show the initial orbital overlap for reaction f.

5. The equilibrium constant for the ring-inversion of fluorocyclohexane is 1.5 at 25 °C. Calculate the fraction of the axial conformer at this temperature.

a) Draw fluorocyclohexane and its ring-flipped conformer.

b) Write the equilibrium equation.

$$K_{\text{eq}} = \frac{[\text{equatorial}]}{[\text{axial}]}$$

c) Solve for the percentage of axial conformer at equilibrium.

$$\% \text{ axial} = \frac{[\text{axial}]}{[\text{axial}] + [\text{equatorial}]}$$

$$[\text{equatorial}] = K_{\text{eq}} [\text{axial}]$$

$$= \frac{[\text{axial}]}{[\text{axial}] + K_{\text{eq}} [\text{axial}]}$$

$$= \frac{[\text{axial}]}{[\text{axial}] (1 + K_{\text{eq}})}$$

$$= \frac{1}{1 + K_{\text{eq}}} = \frac{1}{1 + 1.5} = \frac{1}{2.5} = \boxed{40\%}$$

6. Calculate ΔH for each of the following reactions. (See the table at the end of this problem set).

<u>Bonds Broken</u>	<u>kcal/mol</u>	<u>Bonds Formed</u>	<u>kcal/mol</u>
$\text{CH}_3\text{CH}_2 - \text{Cl}$	81.5	$\text{CH}_3\text{CH}_2 - \text{I}$	53.5
$\text{H} - \text{I}$	71.3	$\text{H} - \text{Cl}$	163.0
	152.8		156.5 kcal/mol

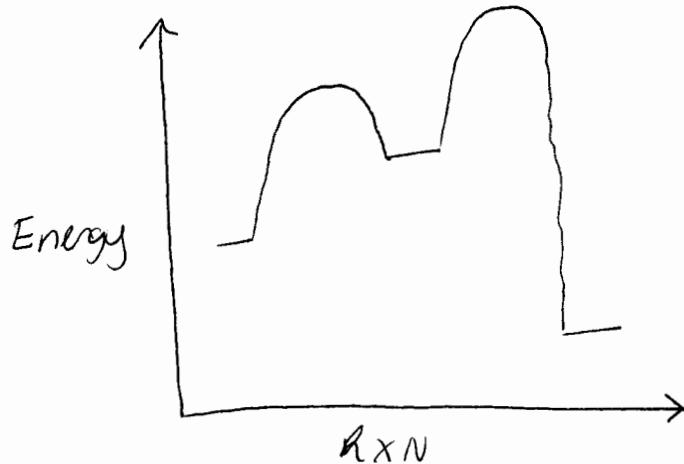

$$\Delta H = 152.8 - 156.5 = -3.7 \text{ kcal/mol}$$

<u>Bonds Broken</u>	<u>kcal/mol</u>	<u>Bonds Formed</u>	<u>kcal/mol</u>
$\text{CH}_3\text{CH}_2 - \text{OH}$	91.5	$\text{CH}_3\text{CH}_2 - \text{Br}$	69
$\text{H} - \text{Br}$	87.5	$\text{H} - \text{OH}$	119
	179		188

$$\Delta H = 179 - 188 = -9.0 \text{ kcal/mol}$$

7. a) Draw an energy diagram for a two-step reaction passing through an intermediate that is less stable than both the starting material and the product, where the product is more stable than the starting material and the activation energy for proceeding from the intermediate to the product is higher than that for proceeding from the intermediate to the starting material.

- b) Which species does the first transition state resemble more closely (circle one)

starting material

intermediate

- c) Which species does the second transition state resemble more closely (circle one)

product

intermediate

- d) Which transition state is involved in the rate determining step of the overall reaction (circle one)?

first

second

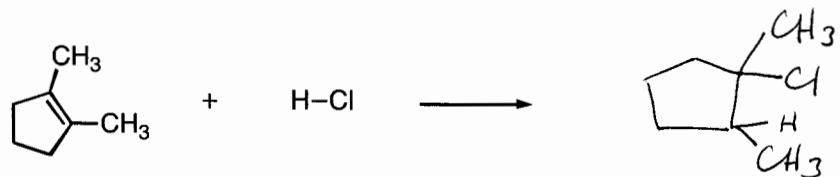

- e) The reaction is: exergonic endergonic

- f) ΔG is: positive negative

- g) K_{eq} is: >1 <1 0

8. Consider the following reaction.

a) Show the product (ignore stereochemistry).

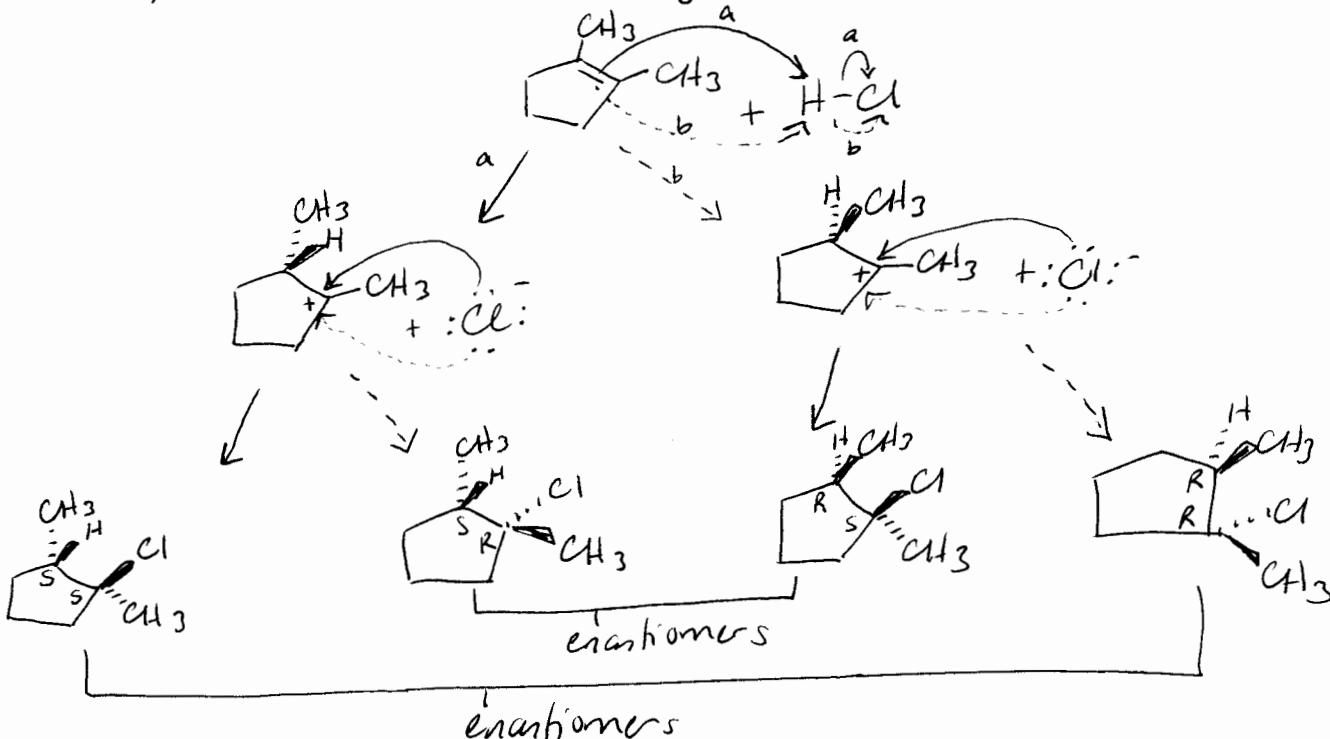

b) How many stereoisomers will form during this reaction?

2 chirality centers

$$2^2 = 4 \text{ stereoisomers}$$

c) Show the mechanism for arriving at each of the stereoisomers.

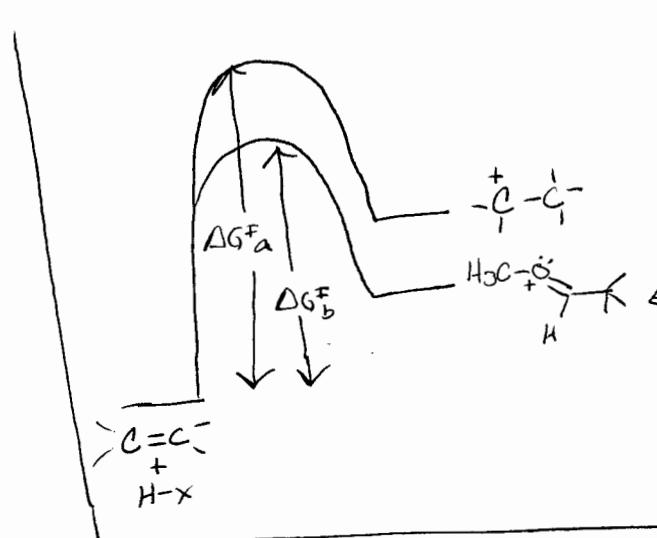

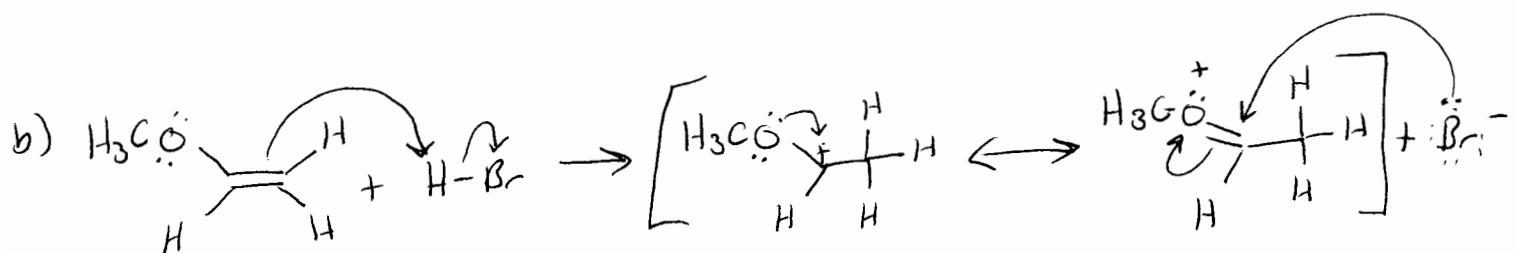

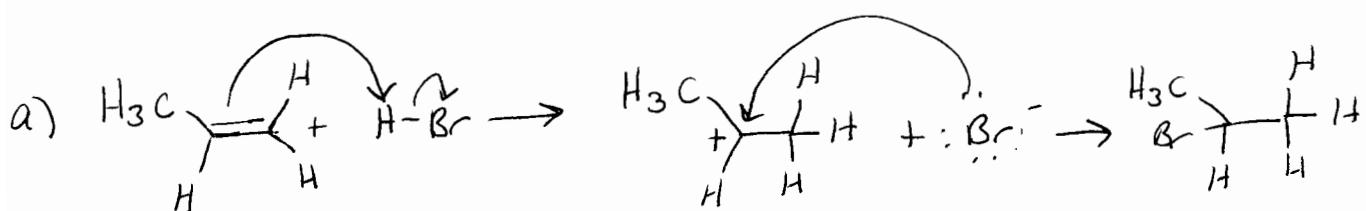

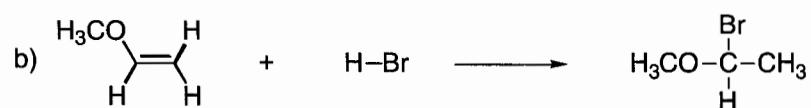

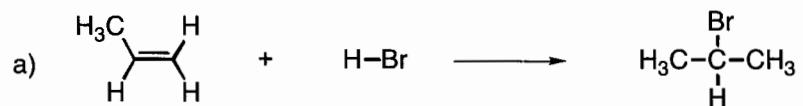

+ 4 sets of diastereomers

d) Label the relationships between the stereoisomers.

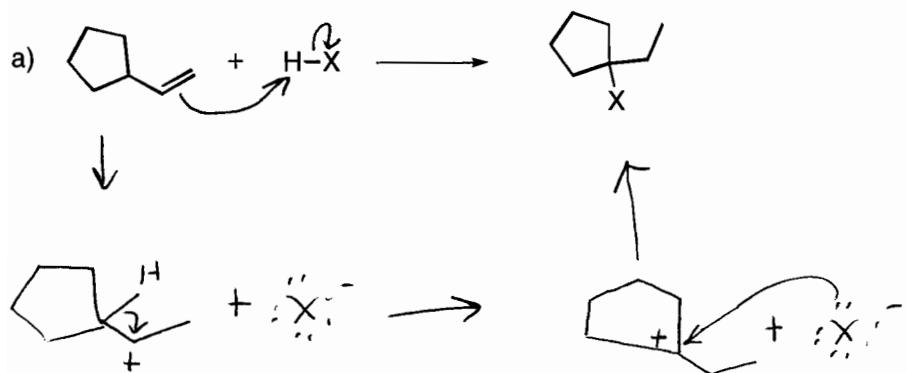

e) The products are (circle one): optically active or **optically inactive**

9. Reaction b proceeds 2.5×10^8 times faster than reaction a. Explain with mechanisms and reaction coordinate diagrams.

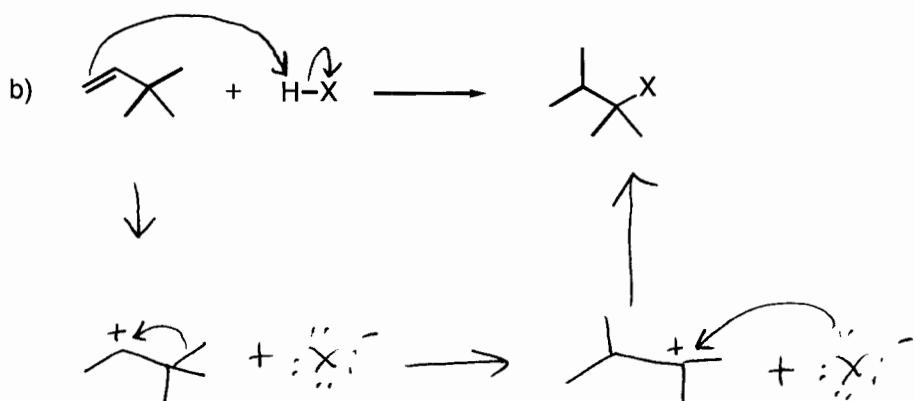

The intermediate of reaction b is resonance stabilized, + lower in energy than the intermediate of reaction a. Formation of the intermediate is an endothermic process. Thus, the structure of the TS^\ddagger resembles the structure of the intermediate. Because the intermediate of b is lower in energy than a, the transition state of b is also lower in energy. Therefore, reaction b has a smaller ΔG^\ddagger + occurs faster.

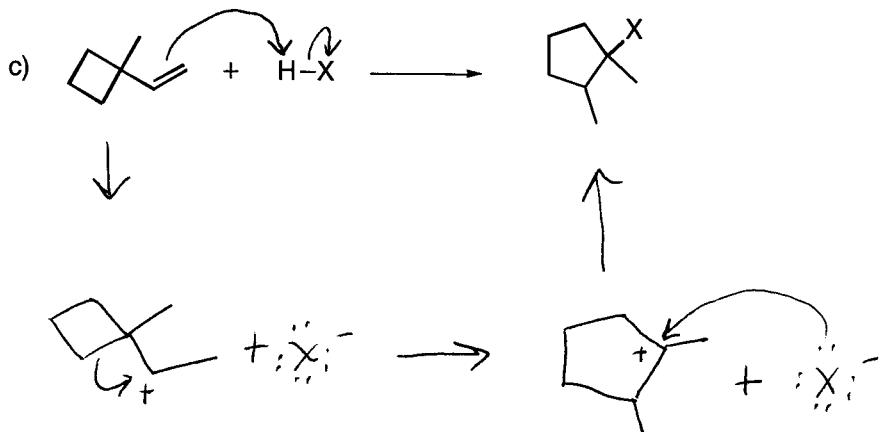

10. Show the mechanism for each reaction.

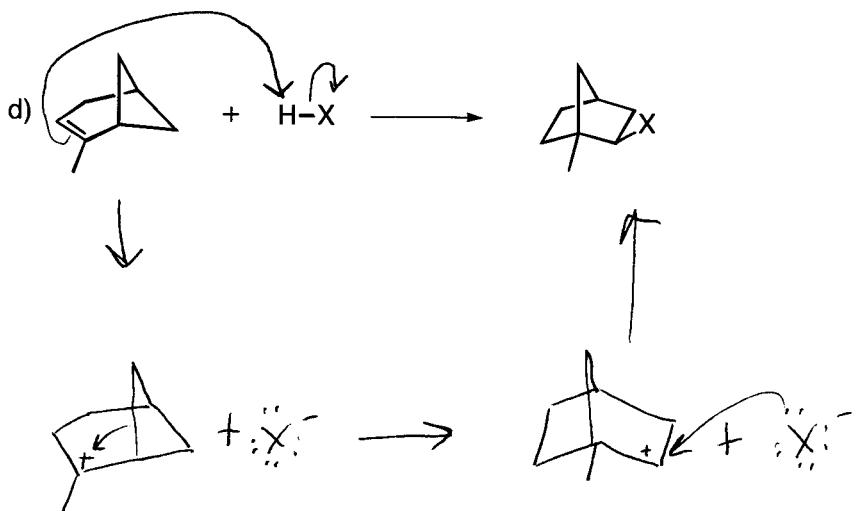

hydride shift: 2° to 3° carbocation

methyl shift: 2° to 3° carbocation

ring expansion 4 (strained) to 5 carbon ring

4 (strained) to 5 carbon ring expansion
