

1.00/1.001

Introduction to Computers and Engineering Problem Solving

Recitation 1

Java and Eclipse

Data Types, Variables, Logical Operators

February 13, 2012

Outline

- Administrative
- Java and Eclipse
- Data Types
- Variables
- Logical Operators
- Homework 1

Reminders

Office Hours

- Wednesday 5pm - 10pm
- Thursday 5pm - 10pm

2 Friday Quizzes: **March 9 & April 13**

Review session before all quizzes and finals.

- Wed. March 7 7pm - 9pm
- Wed. April 11 7pm – 9pm
- Wed. May 16 7pm – 9pm

Academic Honesty Form – Read it! Sign it!

Grading

Homework (10)	40%
Active Learning Exercises	10%
Quiz 1 (March 9)	12%
Quiz 2 (April 13)	12%
Final Exam (TBA)	20%
Recitation Participation	6%

Schedule

February	March	April	May
Introduction to Java: Operators, Control, Data Types, Methods, Classes & Objects, Arrays & ArrayLists	Quiz 1		
	Inheritance, Interfaces	Streams, Sensors & Threads	Data Structures
	Graphical User Interfaces	Numerical Methods	Final

Homework

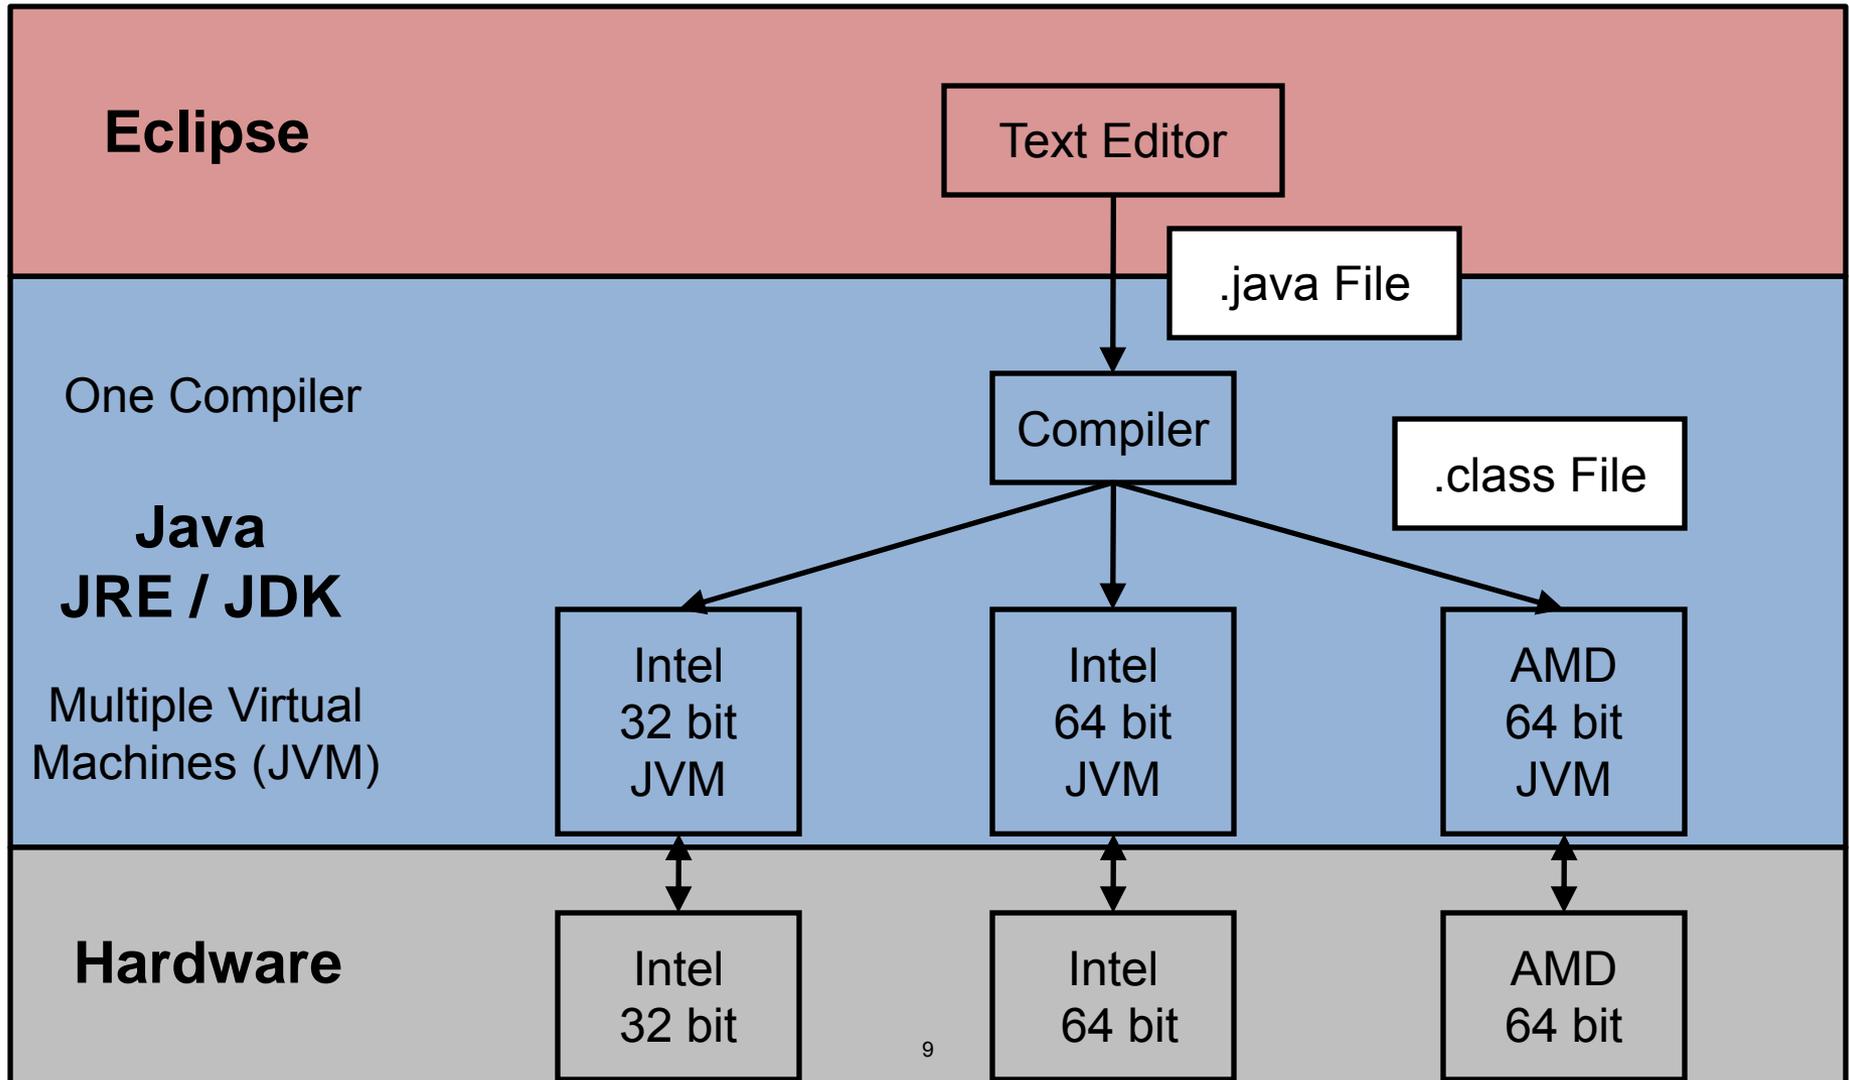

- Hard copy available in lecture a week before due date (2 weeks if quiz)
- Electronic copy available a week before the hard copy
- Due on Friday at 12 noon.
- Submissions accepted until 12 noon on Monday, with a 30-point penalty
- 1 no-penalty late submission (still before Monday 12 noon) – **You still must turn in your pset!**
- A submission is considered late if it has a **late** tag on the website
- Make sure you submit your .java files, and not your .class files
- Group multiple files in a .zip folder
- Every .java file must start with your name, MIT email and section number
- We do not omit your lowest problem set.

```
// Tim B. Ver  
// Student's e-mail address  
// 1.00 Problem Set 1 - Terminal Velocity  
// 9-15-2011  
// TA:  
// Section No. R11
```

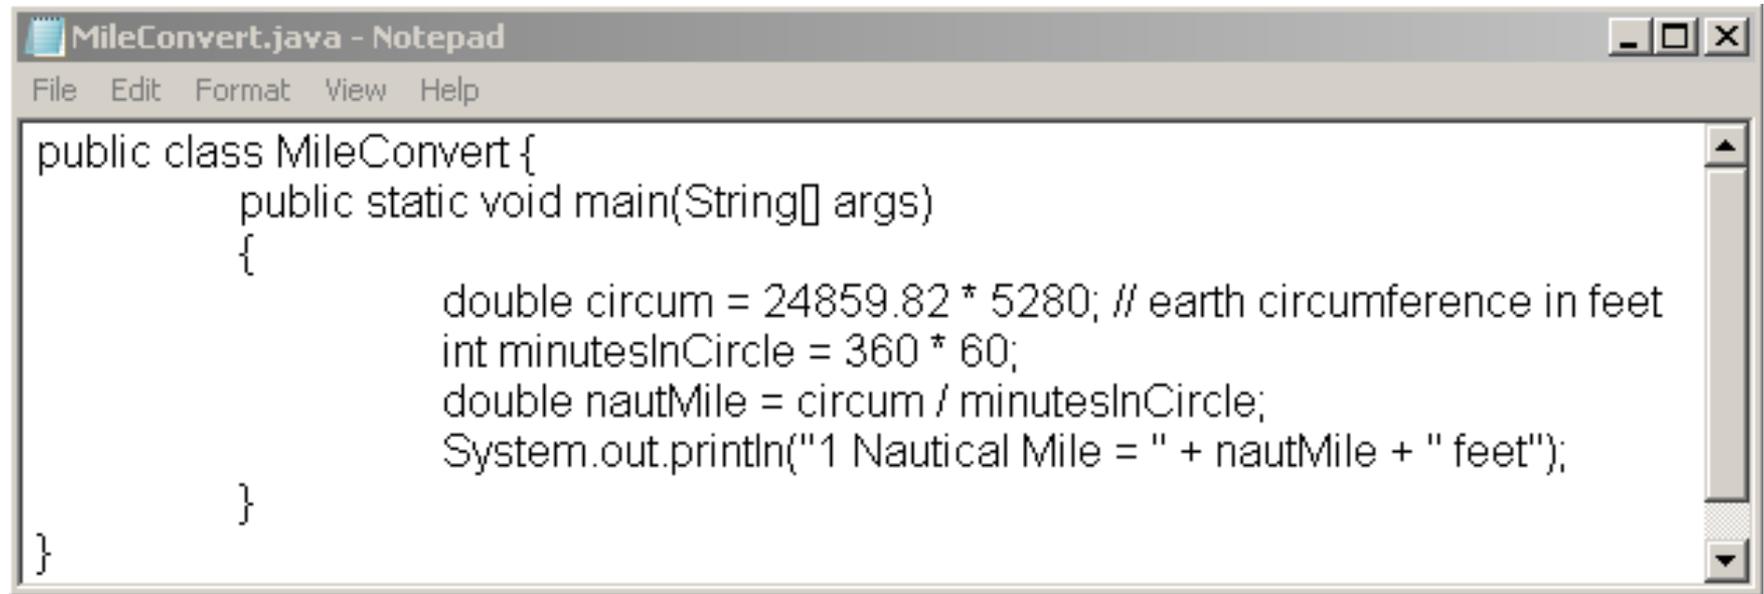

Active Learning Exercises

- Java files to be downloaded before almost every lecture
- Exercises are included in the lecture notes and often use the downloaded files
- Submit your solutions in the *Homework* section of the website before 8pm. No late submissions allowed.
- Java solutions are released in the *Homework* section
- PDF solutions and lecture notes including the solutions are released in the *In-Class Exercises* section
- You can download the lecture notes and the Java files and submit your exercises a week before lecture
- Complete the exercises for 30 lectures to get full credit (10% of final grade)

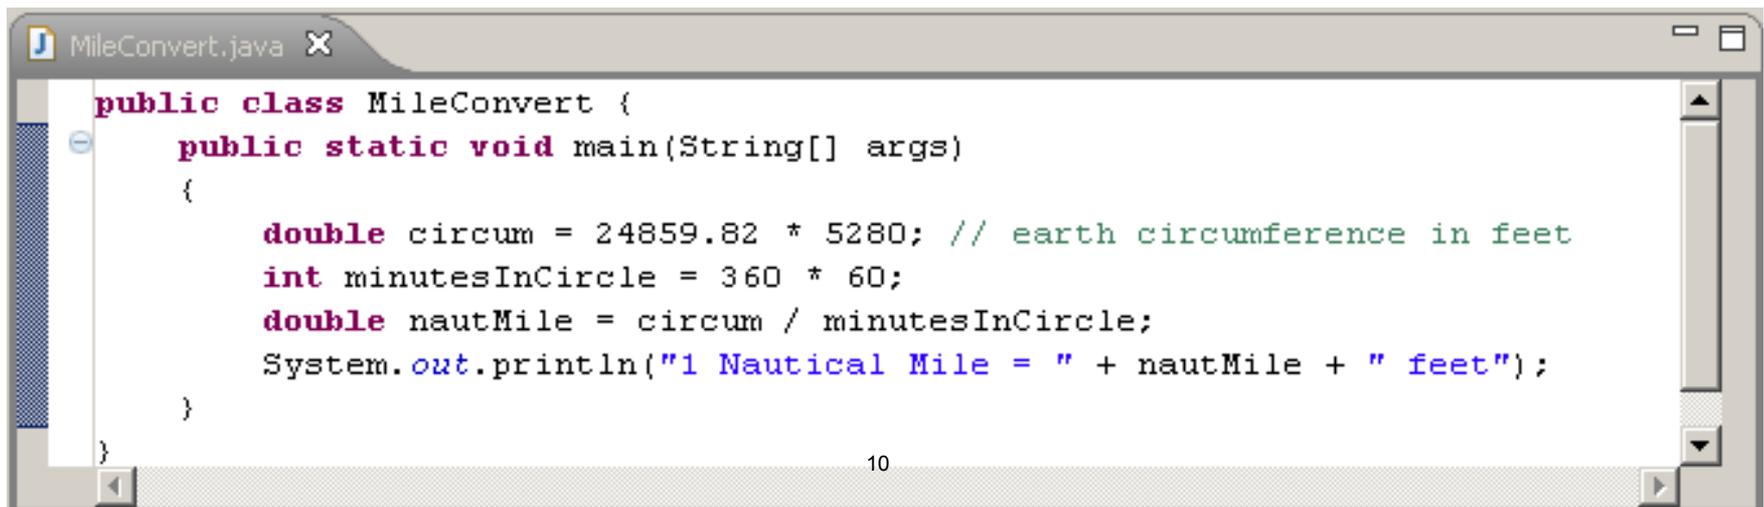

What you Installed

.java File

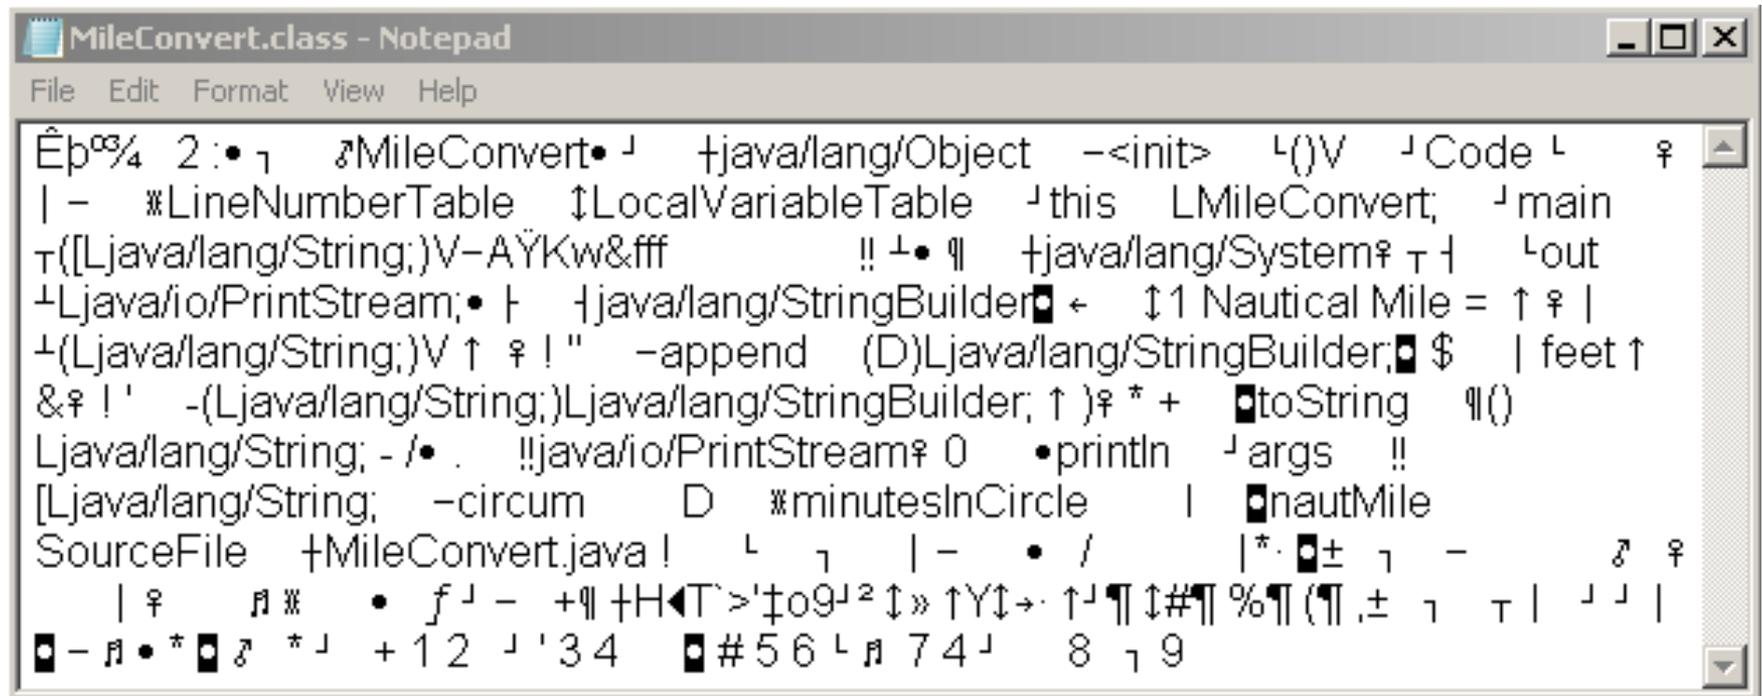

A screenshot of a Notepad window titled "MileConvert.java - Notepad". The window has a menu bar with "File", "Edit", "Format", "View", and "Help". The text area contains the following Java code:

```
public class MileConvert {
    public static void main(String[] args)
    {
        double circum = 24859.82 * 5280; // earth circumference in feet
        int minutesInCircle = 360 * 60;
        double nautMile = circum / minutesInCircle;
        System.out.println("1 Nautical Mile = " + nautMile + " feet");
    }
}
```

A screenshot of an IDE window titled "MileConvert.java". The code is the same as in the Notepad window but with syntax highlighting: keywords like "public", "class", "static", "void", "int", "double", and "System.out.println" are in purple; identifiers like "circum", "minutesInCircle", and "nautMile" are in green; and string literals are in blue. The code is:

```
public class MileConvert {
    public static void main(String[] args)
    {
        double circum = 24859.82 * 5280; // earth circumference in feet
        int minutesInCircle = 360 * 60;
        double nautMile = circum / minutesInCircle;
        System.out.println("1 Nautical Mile = " + nautMile + " feet");
    }
}
```

.class File

Don't submit your .class files !

Java Data Types

8 *primitive* data types

Type	Size (bits)	Range
boolean	1	
char	16	
byte	8	
short	16	
int	32	
long	64	
float	32	
double	64	

Java Data Types

Which data type would you use for:

```
int studentCount = 142;
```

```
char firstLetter = 'a';
```

```
float weight = 180.6F;
```

```
double area = Math.PI * 5.0 * 5.0;
```

```
boolean enjoy100 = true;
```

```
long theNumberOne = 1L;
```

```
double largeNumber = 1.0E100;
```

Java Data Types

boolean

char

byte

short

int

long

float

double

In practice, we will mostly use:

boolean

to represent logic

int, **long** and **double**

to represent numbers

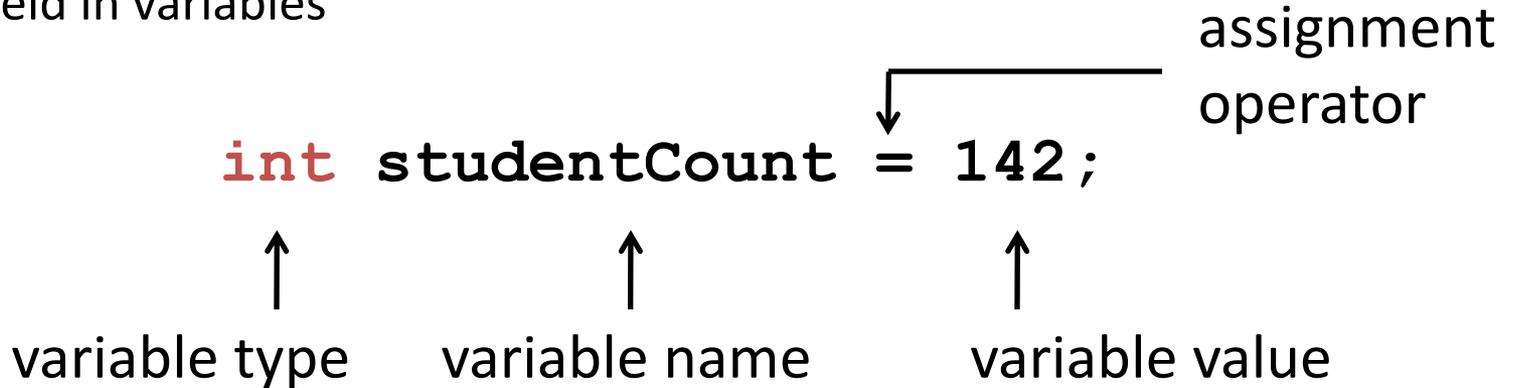

For text, we will use Strings, which are chains of **char**.

e.g. **String text = "Welcome to 1.00";**

A String is an object, not a primitive data type.

Variables

Data is held in variables

- The value on the right is assigned into the left variable name.
- The type of each variable must be declared: Java is a strongly-typed language.
- Variable names typically start with a lowercase letter.
- The variable value must "fit" in the variable type.

Variables

Are these variable declarations acceptable? If yes, are they ideal?

```
boolean b = 1;
```

```
double studentCount = 142;
```

```
byte preRegCount = 110;
```

```
int 2 = facultyCount;
```

Branching: if ... else

- if ... else

```
if (x == 0)
    System.out.println("x is Zero");
else
    System.out.println("x is NonZero");
```

- if ... else if ... else

```
if (x < 0)
    System.out.println("x is Negative");
else if (x == 0)
    System.out.println("x is Zero");
else
    System.out.println("x is Positive");
```

Branching: if ... else

- The **else** statement is not required to terminate branching.

```
// e.g. Take the absolute value of x
```

```
if (x < 0)  
    x = -x;
```

- Use braces { } to execute multiple statements.

```
// e.g. Take the absolute value and notify the user
```

```
if (x < 0) {  
    x = -x;  
    System.out.println("x has been converted");  
}
```

Iteration (Loops)

```
while (condition to continue)
{
    // repeat as long as condition = true
}
```

```
do
{
    // run once and repeat as long as condition = true
}
while (condition to continue)
```

```
for (initial statement; condition to continue; increment statement)
{
    // execute initial statement
    // repeat as long as condition = true
    // execute increment statement after each repetition
}
```

Homework 1

Magnetic Inductance

Due: February 17, 2012

Compute magnetic inductance for 3 different types of antennae:

1. Line antenna
2. Coil antenna
3. Rectangular antenna

Also, **if** (hint) the user selects a coil antenna, and or a rectangular antenna, you will calculate the mutual inductance.

Considerations:

- Ask the user which antenna type
- Parse user inputs using input dialog
- Execute the user's desired calculations
- Print inductance value(s)
- Depending on antenna type, you will also be calculating mutual inductance
