

- d. Determine the time waveform that corresponds to the following Fourier transform, which is zero outside the indicated range.

$$x_3(t) =$$

- e. What is the relation between the answers to parts b and d? In particular, derive an expression for  $x_3(t)$  (the solution to part d) in terms of  $X_2(j\omega)$  (the solution to part b).

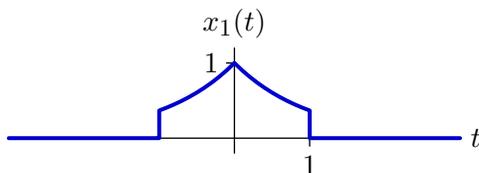

$$x_3(t) =$$

**2. Fourier transform properties**

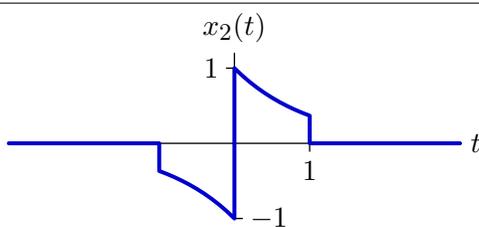

Let  $X(j\omega)$  represent the Fourier transform of

$$x(t) = \begin{cases} e^{-t} & 0 < t < 1 \\ 0 & \text{otherwise} \end{cases}.$$

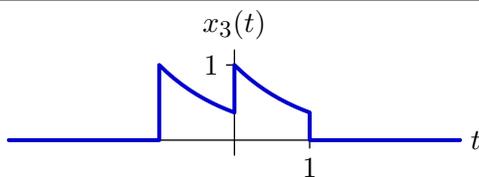

Express the Fourier Transforms of each of the following signals in terms of  $X(j\omega)$ .

$$X_1(j\omega) =$$

$$X_2(j\omega) =$$

$$X_3(j\omega) =$$

**3. Fourier transforms**

Find the Fourier transforms of the following signals.

a.  $x_1(t) = e^{-|t|} \cos(2t)$

$$X_1(j\omega) =$$

b.  $x_2(t) = \frac{\sin(2\pi t)}{\pi(t-1)}$

$$X_2(j\omega) =$$

c.  $x_3(t) = \begin{cases} t^2 & 0 < t < 1 \\ 0 & \text{otherwise} \end{cases}$

$$X_3(j\omega) =$$

d.  $x_4(t) = (1 - |t|) u(t + 1)u(1 - t)$

$$X_4(j\omega) =$$

## Engineering Design Problem

### 4. Parseval's theorem

Parseval's theorem relates time- and frequency-domain methods for calculating the average energy of a signal as follows:

$$\frac{1}{T} \int_T |x(t)|^2 dt = \sum_{k=-\infty}^{\infty} |a_k|^2$$

where  $a_k$  represents the Fourier series coefficients of the periodic signal  $x(t)$  with period  $T$ .

**a.** We can derive Parseval's theorem from the properties of CT Fourier series.

**1.** Let  $y(t) = |x(t)|^2$ . Find the Fourier series coefficients  $b_k$  of  $y(t)$ .  
[Hint:  $|x(t)|^2 = x(t)x^*(t)$ .]

**2.** Use the result from the previous part to derive Parseval's theorem.

**b.** Let  $x_1(t)$  represent the input to an LTI system, where

$$x_1(t) = \sum_{k=-\infty}^{\infty} \alpha^{|k|} e^{jk\frac{\pi}{4}t}$$

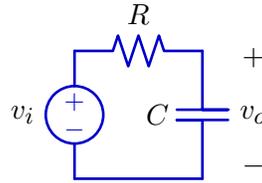

for  $0 < \alpha < 1$ . The frequency response of the system is

$$H(j\omega) = \begin{cases} 1 & |\omega| < W \\ 0 & \text{otherwise.} \end{cases}$$

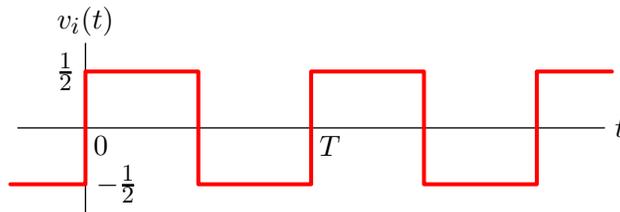

What is the minimum value of  $W$  so that the average energy in the output signal will be at least 90% of that in the input signal.

## 5. Filtering

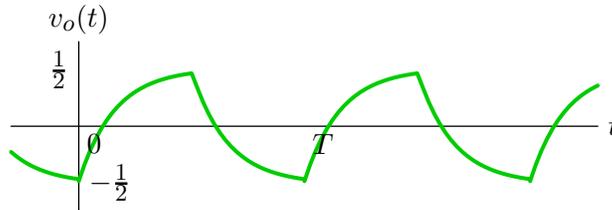

The point of this question is to understand how the magnitude of a filter affects the output and how the angle of a filter affects the output. Consider the following RC circuit as a “filter.”

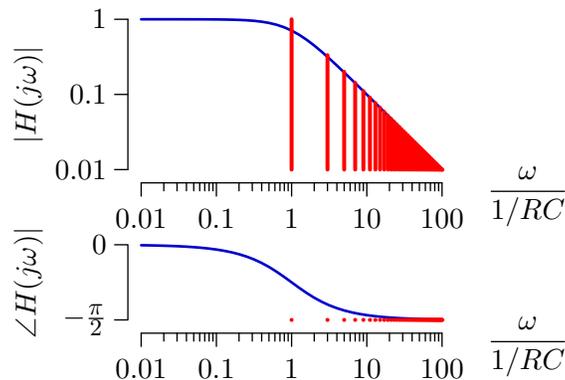

Assume that the input  $v_i(t)$  is the following square wave.

If the fundamental frequency of the square wave ( $\frac{2\pi}{T}$ ) is equal to the cutoff frequency of the RC circuit ( $\frac{1}{RC}$ ) then the output  $v_o(t)$  will have the following form.

We can think of the RC circuit as “filtering” the square wave as shown below.

The RC filter has two effects: (1) The amplitudes of the Fourier components of the input (vertical red lines in upper panel) are multiplied by the magnitude of the frequency response ( $|H(j\omega)|$ ). (2) The phase of the Fourier components (red dots in lower panel) are shifted by the phase of the frequency response ( $\angle H(j\omega)$ ).

- a. Determine (using whatever method you find convenient) the output that would result if  $v_i(t)$  were passed through a filter whose magnitude is  $|H(j\omega)|$  (as above) but whose phase function is 0 for all frequencies. Compare the result with  $v_o(t)$  above.

- b. Determine (using whatever method you find convenient) the output that would result if  $v_i(t)$  were passed through a filter whose phase function is  $\angle H(j\omega)$  (as above) but whose magnitude function is 1 for all frequencies. Compare the result with  $v_o(t)$  above.
