

LECTURE 13

The Bernoulli process

- **Readings:** Section 6.1

Lecture outline

- Definition of Bernoulli process
- Random processes
- Basic properties of Bernoulli process
- Distribution of interarrival times
- The time of the k th success
- Merging and splitting

The Bernoulli process

- A sequence of independent Bernoulli trials
- At each trial, i :
 - $P(\text{success}) = P(X_i = 1) = p$
 - $P(\text{failure}) = P(X_i = 0) = 1 - p$
- Examples:
 - Sequence of lottery wins/losses
 - Sequence of ups and downs of the Dow Jones
 - Arrivals (each second) to a bank
 - Arrivals (at each time slot) to server

Random processes

- First view:
sequence of random variables X_1, X_2, \dots
- $E[X_t] =$
- $\text{Var}(X_t) =$
- Second view:
what is the right sample space?
- $P(X_t = 1 \text{ for all } t) =$
- Random processes we will study:
 - Bernoulli process
(memoryless, discrete time)
 - Poisson process
(memoryless, continuous time)
 - Markov chains
(with memory/dependence across time)

Number of successes S in n time slots

- $P(S = k) =$
- $E[S] =$
- $\text{Var}(S) =$

Interarrival times

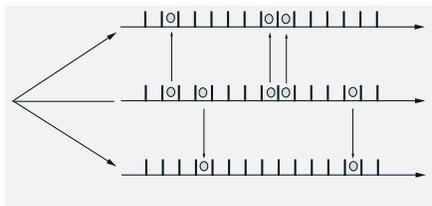

- T_1 : number of trials until first success
 - $P(T_1 = t) =$
 - Memoryless property
 - $E[T_1] =$
 - $\text{Var}(T_1) =$
- If you buy a lottery ticket every day, what is the distribution of the length of the first string of losing days?

Time of the k th arrival

- Given that first arrival was at time t i.e., $T_1 = t$:
 - additional time, T_2 , until next arrival
 - has the same (geometric) distribution
 - independent of T_1
- Y_k : number of trials to k th success
 - $E[Y_k] =$
 - $\text{Var}(Y_k) =$
 - $P(Y_k = t) =$

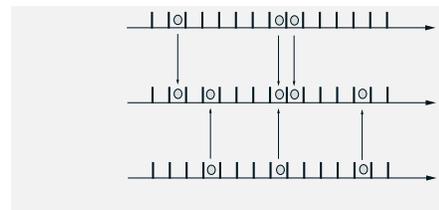

Splitting of a Bernoulli Process

(using independent coin flips)

yields Bernoulli processes

Merging of Indep. Bernoulli Processes

yields a Bernoulli process
(collisions are counted as one arrival)
