

## LECTURE 25

### Outline

- **Reference:** Section 9.4
- Course Evaluations (until 12/16)  
<http://web.mit.edu/subjectevaluation>
- Review of simple binary hypothesis tests
  - examples
- Testing composite hypotheses
  - is my coin fair?
  - is my die fair?
  - goodness of fit tests

### Simple binary hypothesis testing

- **null hypothesis**  $H_0$ :  
 $X \sim p_X(x; H_0)$  [or  $f_X(x; H_0)$ ]
- **alternative hypothesis**  $H_1$ :  
 $X \sim p_X(x; H_1)$  [or  $f_X(x; H_1)$ ]
- Choose a **rejection region**  $R$ ;  
 reject  $H_0$  iff data  $\in R$
- Likelihood ratio test: reject  $H_0$  if
 
$$\frac{p_X(x; H_1)}{p_X(x; H_0)} > \xi \quad \text{or} \quad \frac{f_X(x; H_1)}{f_X(x; H_0)} > \xi$$
- fix false rejection probability  $\alpha$   
 (e.g.,  $\alpha = 0.05$ )
- choose  $\xi$  so that  $P(\text{reject } H_0; H_0) = \alpha$

### Example (test on normal mean)

- $n$  data points, i.i.d.  
 $H_0: X_i \sim N(0, 1)$   
 $H_1: X_i \sim N(1, 1)$
- Likelihood ratio test; rejection region:  

$$\frac{(1/\sqrt{2\pi})^n \exp\{-\sum_i (X_i - 1)^2/2\}}{(1/\sqrt{2\pi})^n \exp\{-\sum_i X_i^2/2\}} > \xi$$
  - algebra: reject  $H_0$  if:  $\sum_i X_i > \xi'$
- Find  $\xi'$  such that  

$$P\left(\sum_{i=1}^n X_i > \xi'; H_0\right) = \alpha$$
  - use normal tables

### Example (test on normal variance)

- $n$  data points, i.i.d.  
 $H_0: X_i \sim N(0, 1)$   
 $H_1: X_i \sim N(0, 4)$
- Likelihood ratio test; rejection region:  

$$\frac{(1/2\sqrt{2\pi})^n \exp\{-\sum_i X_i^2/(2 \cdot 4)\}}{(1/\sqrt{2\pi})^n \exp\{-\sum_i X_i^2/2\}} > \xi$$
  - algebra: reject  $H_0$  if  $\sum_i X_i^2 > \xi'$
- Find  $\xi'$  such that  

$$P\left(\sum_{i=1}^n X_i^2 > \xi'; H_0\right) = \alpha$$
  - the distribution of  $\sum_i X_i^2$  is known  
 (derived distribution problem)
  - “chi-square” distribution;  
 tables are available

## Composite hypotheses

- Got  $S = 472$  heads in  $n = 1000$  tosses; is the coin fair?
  - $H_0 : p = 1/2$  versus  $H_1 : p \neq 1/2$
- Pick a “**statistic**” (e.g.,  $S$ )
- Pick shape of **rejection region** (e.g.,  $|S - n/2| > \xi$ )
- Choose **significance level** (e.g.,  $\alpha = 0.05$ )
- Pick **critical value**  $\xi$  so that:

$$P(\text{reject } H_0; H_0) = \alpha$$

Using the CLT:

$$P(|S - 500| \leq 31; H_0) \approx 0.95; \quad \xi = 31$$

- In our example:  $|S - 500| = 28 < \xi$   
 $H_0$  **not rejected** (at the 5% level)

## Is my die fair?

- Hypothesis  $H_0$ :  
 $P(X = i) = p_i = 1/6, i = 1, \dots, 6$
- Observed occurrences of  $i$ :  $N_i$
- Choose form of rejection region;  
 chi-square test:

$$\text{reject } H_0 \text{ if } T = \sum_i \frac{(N_i - np_i)^2}{np_i} > \xi$$

- Choose  $\xi$  so that:

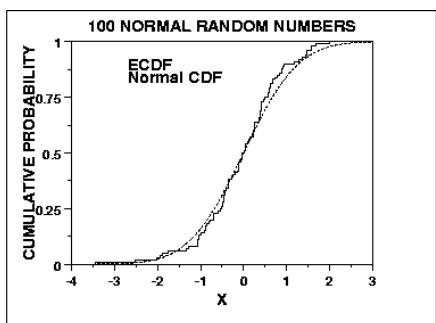

$$P(\text{reject } H_0; H_0) = 0.05$$

$$P(T > \xi; H_0) = 0.05$$

- Need the distribution of  $T$ :  
 (CLT + derived distribution problem)
  - for large  $n$ ,  $T$  has approximately a chi-square distribution
  - available in tables

## Do I have the correct pdf?

- Partition the range into bins
  - $np_i$ : expected incidence of bin  $i$  (from the pdf)
  - $N_i$ : observed incidence of bin  $i$
  - Use chi-square test (as in die problem)
- Kolmogorov-Smirnov test:  
 form **empirical CDF**,  $\hat{F}_X$ , from data

(<http://www.itl.nist.gov/div898/handbook/>)

- $D_n = \max_x |F_X(x) - \hat{F}_X(x)|$
- $P(\sqrt{n}D_n \geq 1.36) \approx 0.05$

## What else is there?

- Systematic methods for coming up with shape of rejection regions
- Methods to estimate an unknown PDF (e.g., form a histogram and “smooth” it out)
- Efficient and recursive signal processing
- Methods to select between less or more complex models
  - (e.g., identify relevant “explanatory variables” in regression models)
- Methods tailored to high-dimensional unknown parameter vectors and huge number of data points (data mining)
- etc. etc....
