

Summarization

Regina Barzilay

March 8, 2003

Today

- Summarization (content selection, evaluation)
- Techniques: alignment, classification, rewriting

What is Summarizer

- Find important information in a text
- Learn transformation rules based on training instances
- Extract certain facts from a text, and combine them into a text

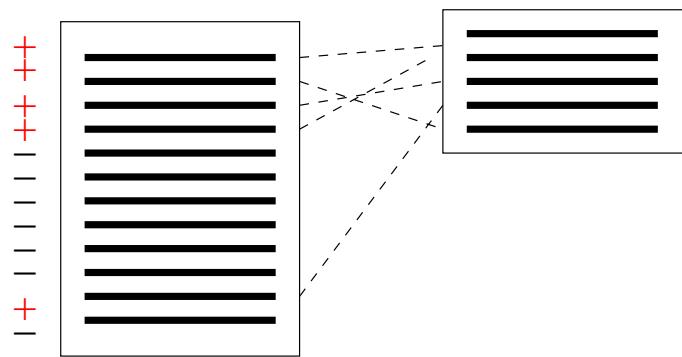

Types of Summarization

- Input: speech/text, single-/multi-document
- Output: generic/query-oriented
- Approach: domain dependent/independent,
extraction/generation

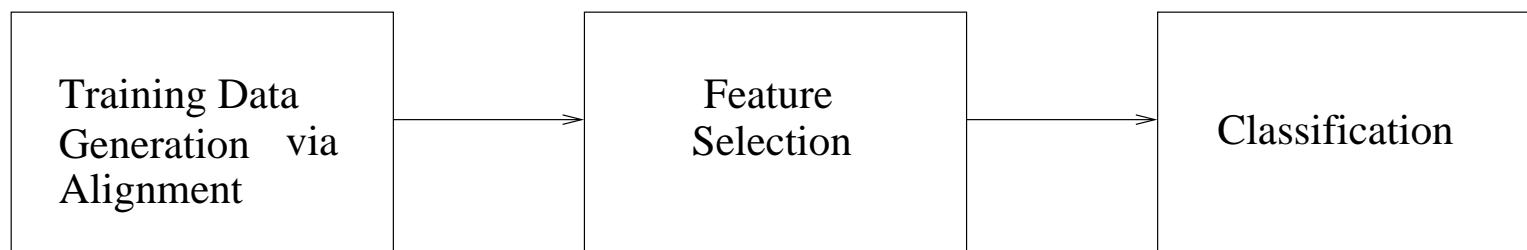

Key Questions

- Content selection
- Content organization and linguistic realization
- Evaluation

Supervised Approaches

Supervised Approaches

Supervised Approaches

- Alignment (trivial for extraction, hard for generation)
- Feature Selection
- Classification (standard classifiers — Naive Bayes, SVM, maximum entropy, Boostexter)

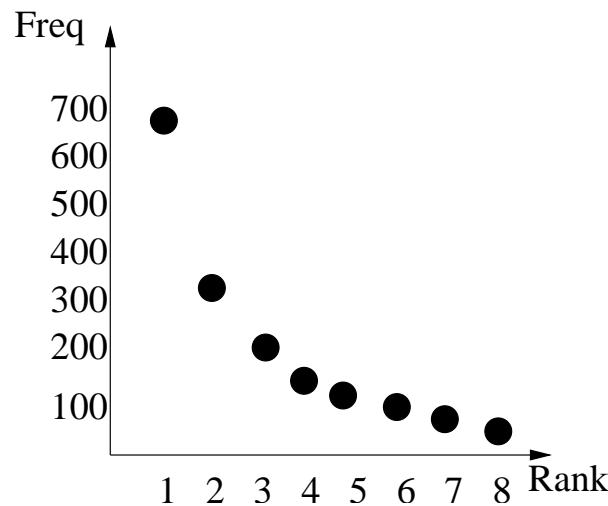

Feature Selection

Shallow Features:

- Locational Features (in the newspaper genre, the first paragraph is a summary)
- Presence of cue words (e.g., “in conclusion”)
- Sentence length
- Number of highly weighted words in a sentence

Zipf Distribution

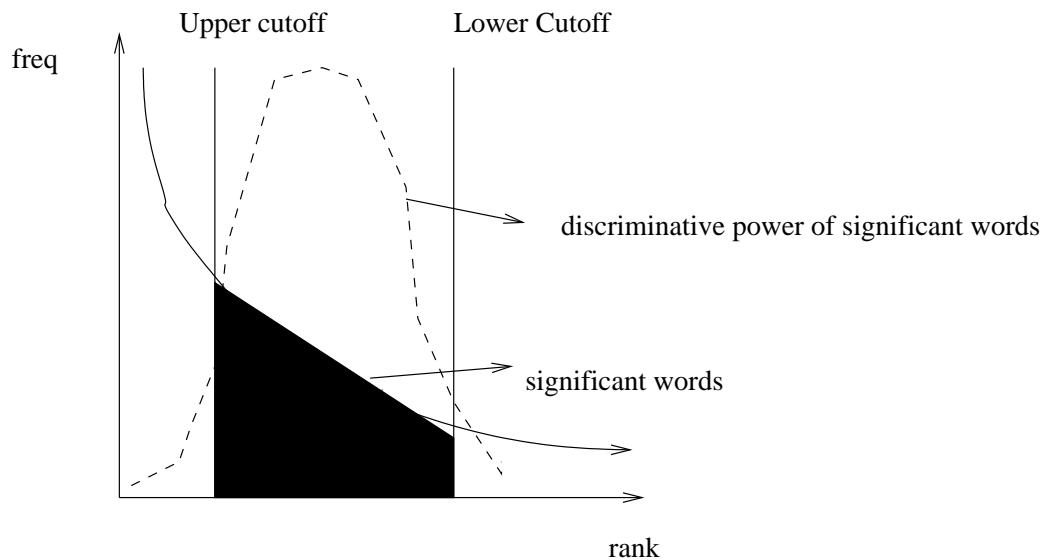

The product of the frequency of words (f) and their rank(r) is approximately constant: $f * R = C$ (where C is around $N/10$)

Rank = order of words' frequency of occurrence

Word Frequency vs Resolving Power

(from van Rijsbergen, 1979) The most frequent words are not the most descriptive

Assigning Weights

- Raw frequencies (typically with the list of stop-words)
- TF*IDF – a way to deal with the problem of the Zipf distribution
 - TF - Term frequency
 - IDF - Inverse term frequency

TF*IDF

$$w_{ik} = T f_{ik} * \log(N/n_k)$$

w_{ik} — Term k in document D_i

$T f_{ik}$ — Frequency of term k in document D_i

N — total number of documents in the collection C

n_k — total number of documents in the collection C
that contain T_k

Feature Selection

“Deep Features”

- Rhetorical structure based
 - RST (Marcu, 2000)
 - Domain-dependent argumentative structure
(Teufel&Moens, 2000)
- Content-based (Barzilay&Lee, 2003)

Alignment Input

Amsterdam is the largest city in The Netherlands and the country's economic center. It is the official capital of The Netherlands, though The Hague is the home of the government. Tourists come to see Amsterdam's historic attractions and collections of great art. They admire the city's scenic canals, bridges, and stately old houses. Amsterdam is also famous for its atmosphere of freedom and tolerance.

City and port, western Netherlands, located on the IJsselmeer and connected to the North Sea. It is the capital and the principal commercial and financial centre of The Netherlands. To the scores of tourists who visit each year, Amsterdam is known for its historical attractions, for its collections of great art, and for the distinctive colour and flavour of its old sections, which have been so well preserved. However, visitors to the city also see a crowded metropolis beset by environmental pollution, traffic congestion, and housing shortages. It is easy to describe Amsterdam, which is more than 700 years old, as a living museum of a bygone age and to praise the eternal beauty of the centuries-old canals, the ancient patrician houses, and the atmosphere of freedom and tolerance, but the modern city is still working out solutions to the pressing urban problems that confront it. Amsterdam is the nominal capital of The Netherlands but not the seat of government, which is The Hague. The royal family, for example, is only occasionally in residence at the Royal Palace, on the square known as the Dam, in Amsterdam.

Alignment Output

Amsterdam is the largest city in The Netherlands and the countrys economic center. It is the official capital of The Netherlands, though The Hague is the home of the government. Tourists come to see Amsterdams historic attractions and collections of great art. They admire the citys scenic canals, bridges, and stately old houses. Amsterdam is also famous for its atmosphere of freedom and tolerance.

The royal family, for example, is only occasionally in residence at the Royal Palace, on the square known as the Dam, in Amsterdam.

Alignment in MT

- Alignment task: Given bitext, identify units which are translations of each other.
- Units: paragraphs, sentences, phrases, words.
- Usage: first step for full translation(Brown et al), lexicography(Dagan & Church, Fung & McKeown), aid for human translators(Shemtov), multi-lingual IR.

Length-based Alignment

- Matching Predicate: Long sentences will be translated as long sentences, short sentences translated as short sentences
- Method: Dynamic programming

Length-based Alignment

Let $D(i, j)$ be the lowest cost alignment between sentences s_1, \dots, s_i and t_1, \dots, t_j .

Base: $D(0, 0) = 0$.

$$D(i, j) = \min \left\{ \begin{array}{l} D(i, j - 1) + \text{cost}(0:1 \text{ align } \phi, t_j) \\ D(i - 1, j) + \text{cost}(1:0 \text{ align } s_i, \phi) \\ D(i - 1, j - 1) + \text{cost}(1:1 \text{ align } s_i, t_j) \\ D(i - 1, j - 2) + \text{cost}(1:2 \text{ align } s_i, t_{j-1}, t_j) \\ D(i - 2, j - 1) + \text{cost}(2:1 \text{ align } s_{i-1}, s_i, t_j) \\ D(i - 2, j - 2) + \text{cost}(2:2 \text{ align } s_{i-1}, s_i, t_{j-1}, t_j) \end{array} \right.$$

Design Choices in Alignment

Determined by a Corpus Type

- Matching predicate
- Search strategy

Corpus Type

- Language Proximity (Monolingual vs Bilingual, technical vs lay)
- Content Proximity (comparable vs parallel)
- Matching Granularity (1:1 vs 1:5)

Matching Predicate

- Length similarity. (Gale & Church, Brown et al)
- Lexical similarity:
 - Bilingual dictionary (Wu)
 - Words with the same distribution. (Kay & Roscheisen, Fung & McKeown)
 - Cognates (Simard et al, Church, Melamed)

Methods for Overall Alignment

- Dynamic programming
- Methods based on Computational Geometry
- Signal processing Methods

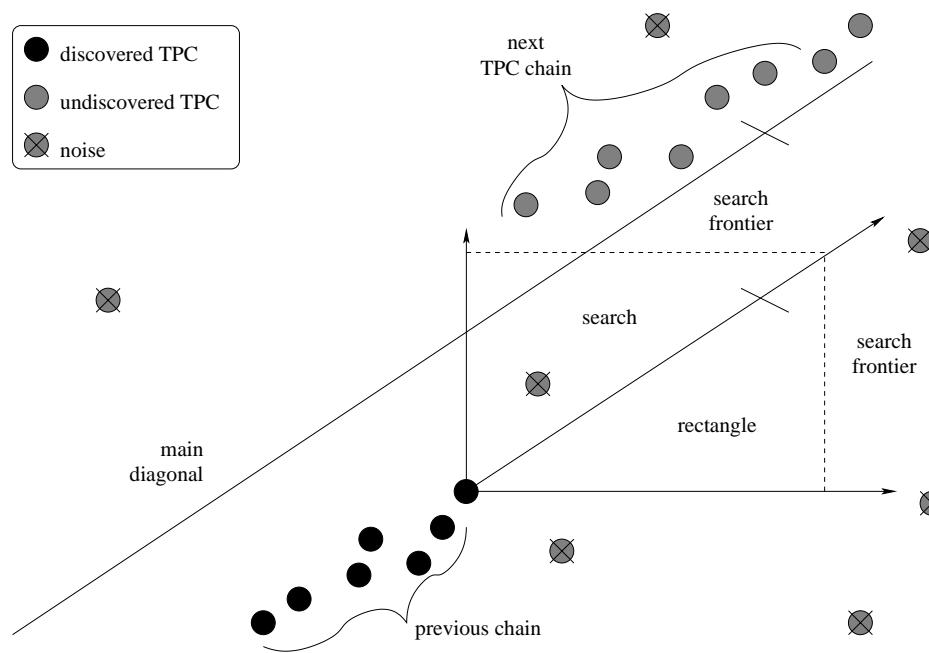

Computational Geometry Methods

(Melamed, 1997) Assumption: Distribution of “true points of correspondence (TPC)” satisfies certain geometric properties

- Generate all the matching points satisfying the matching predicate (over-generation)
- Find a subset of matching points that satisfies a pattern of TPC:
 - Linearity
 - Injectivity
 - Low variance of slope

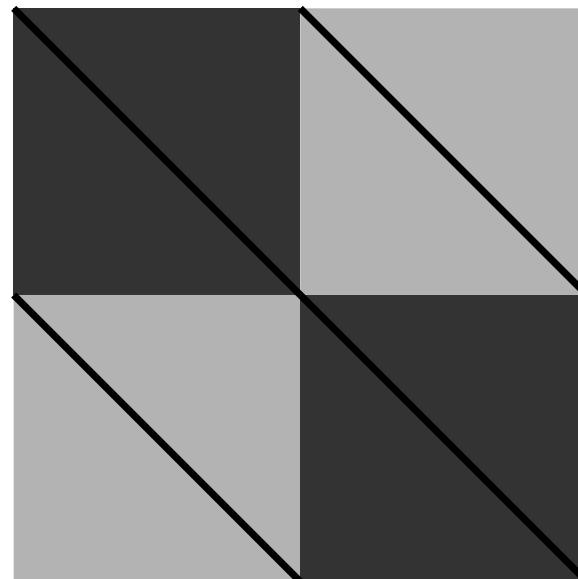

Various heuristics are used to minimize the search space

Computational Geometry Methods

Signal Processing Methods

(Fung, 1995)

Alignment for Summarization

- Always monolingual
- Seems to be trivial (use word intersection!)

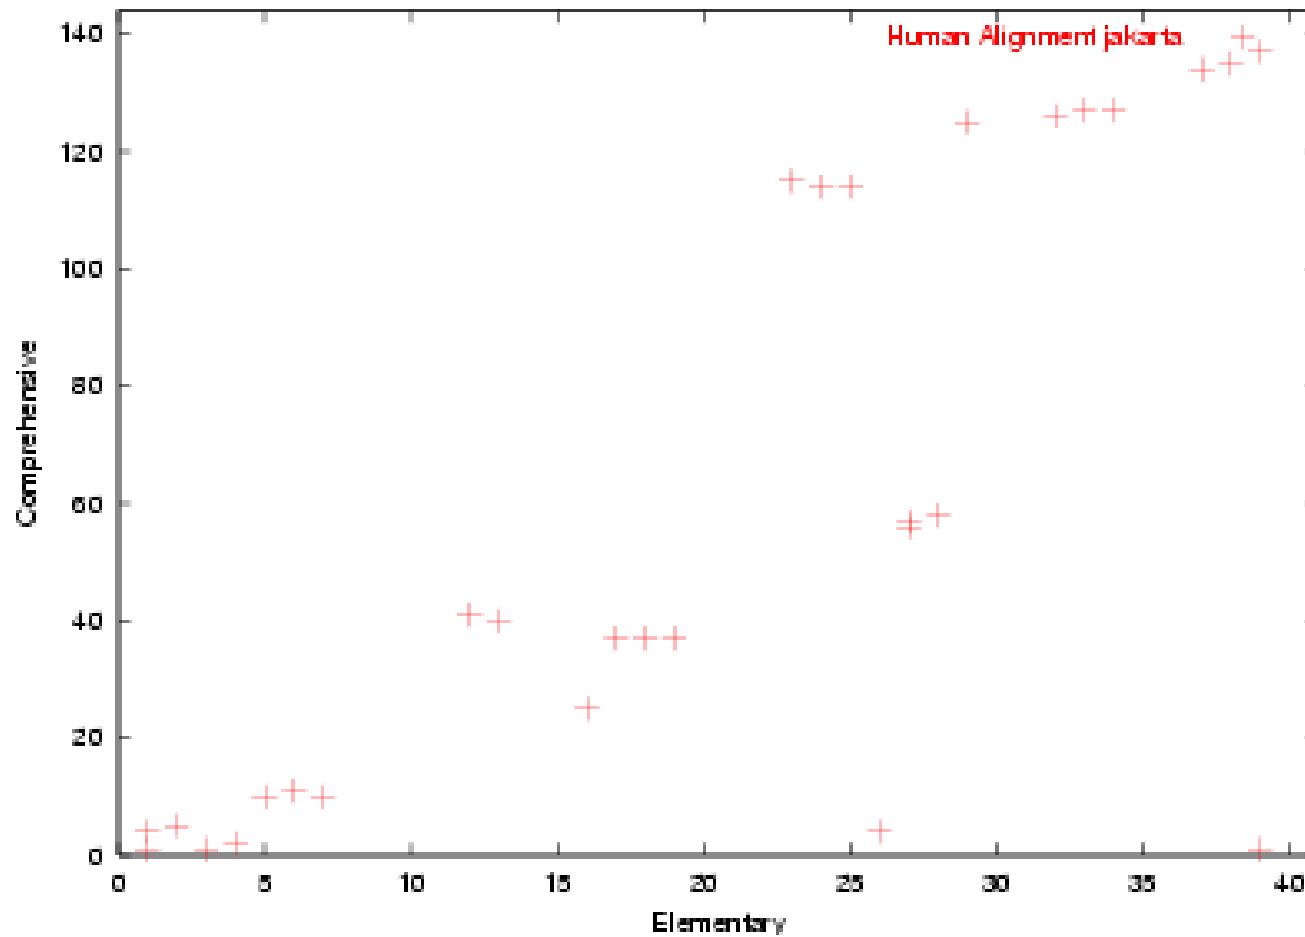

It is hard!

- Insertions, deletions, reordering
- Weak similarity function

Weak Similarity Function

(A)	<ul style="list-style-type: none">• Petersburg served as the capital of Russia for 200 years.• For two centuries Petersburg was the capital of the Russian Empire.
(B)	<ul style="list-style-type: none">• The city is also the country's leading port and center of commerce.• And yet, as with so much of the city, the port facilities are old and inefficient.

Patterns of Mapping

Domain-Dependent Structure-Based Alignment

(Barzilay&Elhadad, 2003) Assumption: Weak similarity function augmented with structural information

- Content Structure Induction
- Learning of Structural Mapping Rules
- Macro Alignment
- Micro Alignment

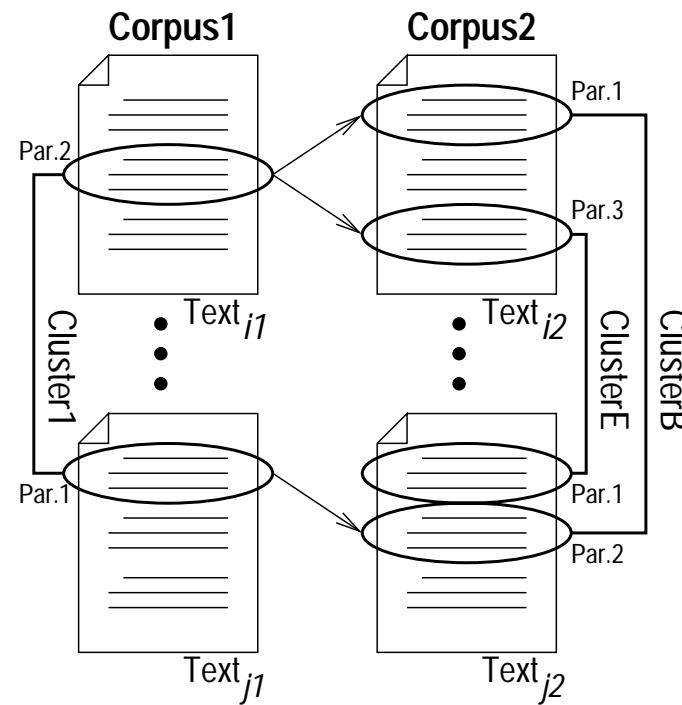

Content Structure Induction

Automatically induced topic labeling via clustering

Lisbon has a mild and equable climate, with a mean annual temperature of 63 degree F (17 degree C). The proximity of the Atlantic and the frequency of sea fogs keep the atmosphere humid, and summers can be somewhat oppressive, although the city has been esteemed as a winter health resort since the 18th century. Average annual rainfall is 26.6 inches (666 millimetres).

Jakarta is a tropical, humid city, with annual temperatures ranging between the extremes of 75 and 93 degree F (24 and 34 degree C) and a relative humidity between 75 and 85 percent. The average mean temperatures are 79 degree F (26 degree C) in January and 82 degree F (28 degree C) in October. The annual rainfall is more than 67 inches (1,700 mm). Temperatures are often modified by sea winds. Jakarta, like any other large city, also has its share of air and noise pollution.

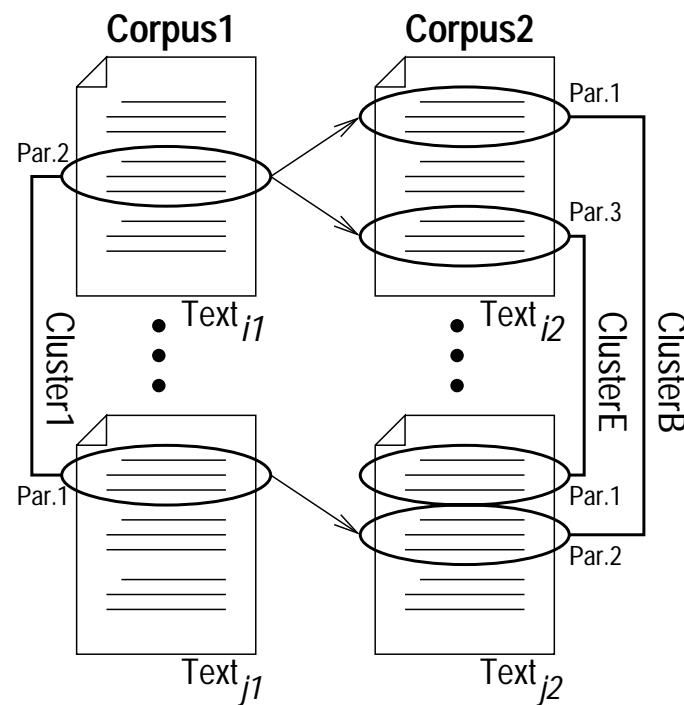

Learning of Structural Mapping Rules

Learning of Structural Mapping Rules

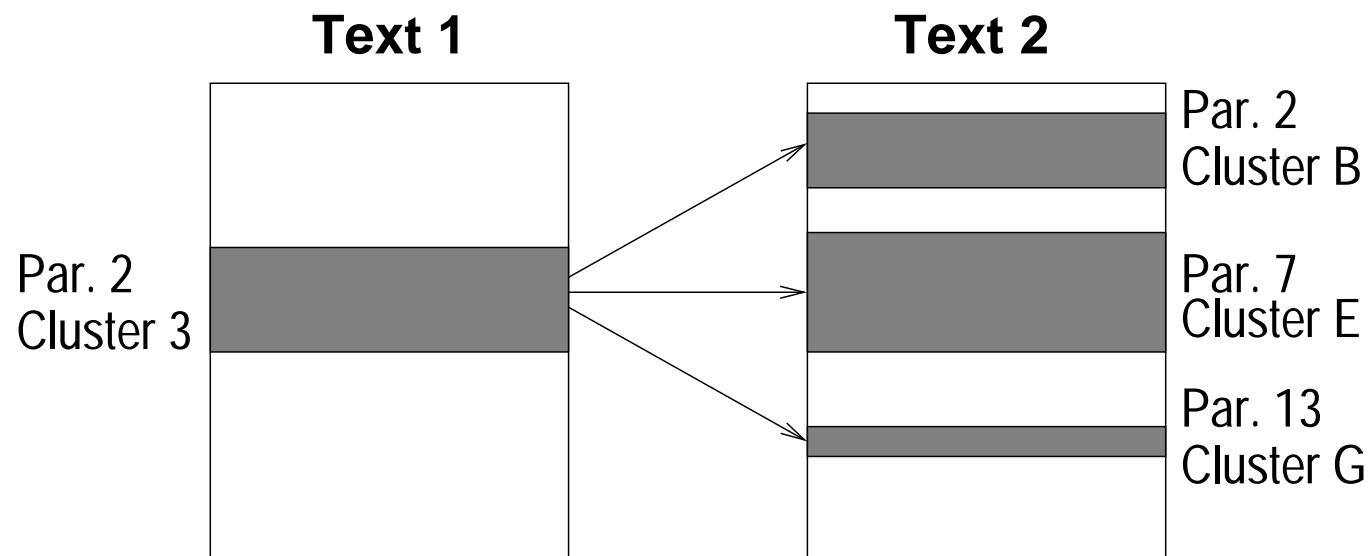

Classification on cluster level

Features: words, cluster type

Macro-Alignment

For unseens pair of texts applied a trained classifier to generate possible mappings

Micro-Alignment

$$s(i, j) = \max \begin{cases} s(i, j-1) - \text{skip_penalty} \\ s(i-1, j) - \text{skip_penalty} \\ s(i-1, j-1) + \text{sim}(i, j) \\ s(i-1, j-2) + \text{sim}(i, j) + \text{sim}(i, j-1) \\ s(i-2, j-1) + \text{sim}(i, j) + \text{sim}(i-1, j) \\ s(i-2, j-2) + \text{sim}(i, j-1) + \text{sim}(i-1, j) \end{cases}$$

Evaluation

Range	Struct		Cos.	
	Prec.	Rec.	Prec.	Rec.
0%–40%	50%	25%	23%	15%
40%–70%	85%	73%	66%	86%
70%–100%	95%	95%	90%	95%

Summarization Evaluation

- Precision/Recall or their weighted version are used
- As a baseline, people use a “lead” summary
- Human agreement is computed using Kappa
- When evaluation results matter, it is done manually (DUC competition)
 - Provides large collection of human-generated summaries
 - Outputs are evaluated manually

Semantic-based Summarization

Assumption: In a limited domain, we know “what is important” (Radev&McKeown, 1995, Elhadad&McKeown, 2001)

- Use an information extraction system to select “important information”
- Use a semantics-to-text generation system to generate a new text
