

Organizations and Projects

Lecture 15

November 13, 2012

Prof. Dan Braha

http://necsi.edu/affiliates/braha/dan_braha-description.htm

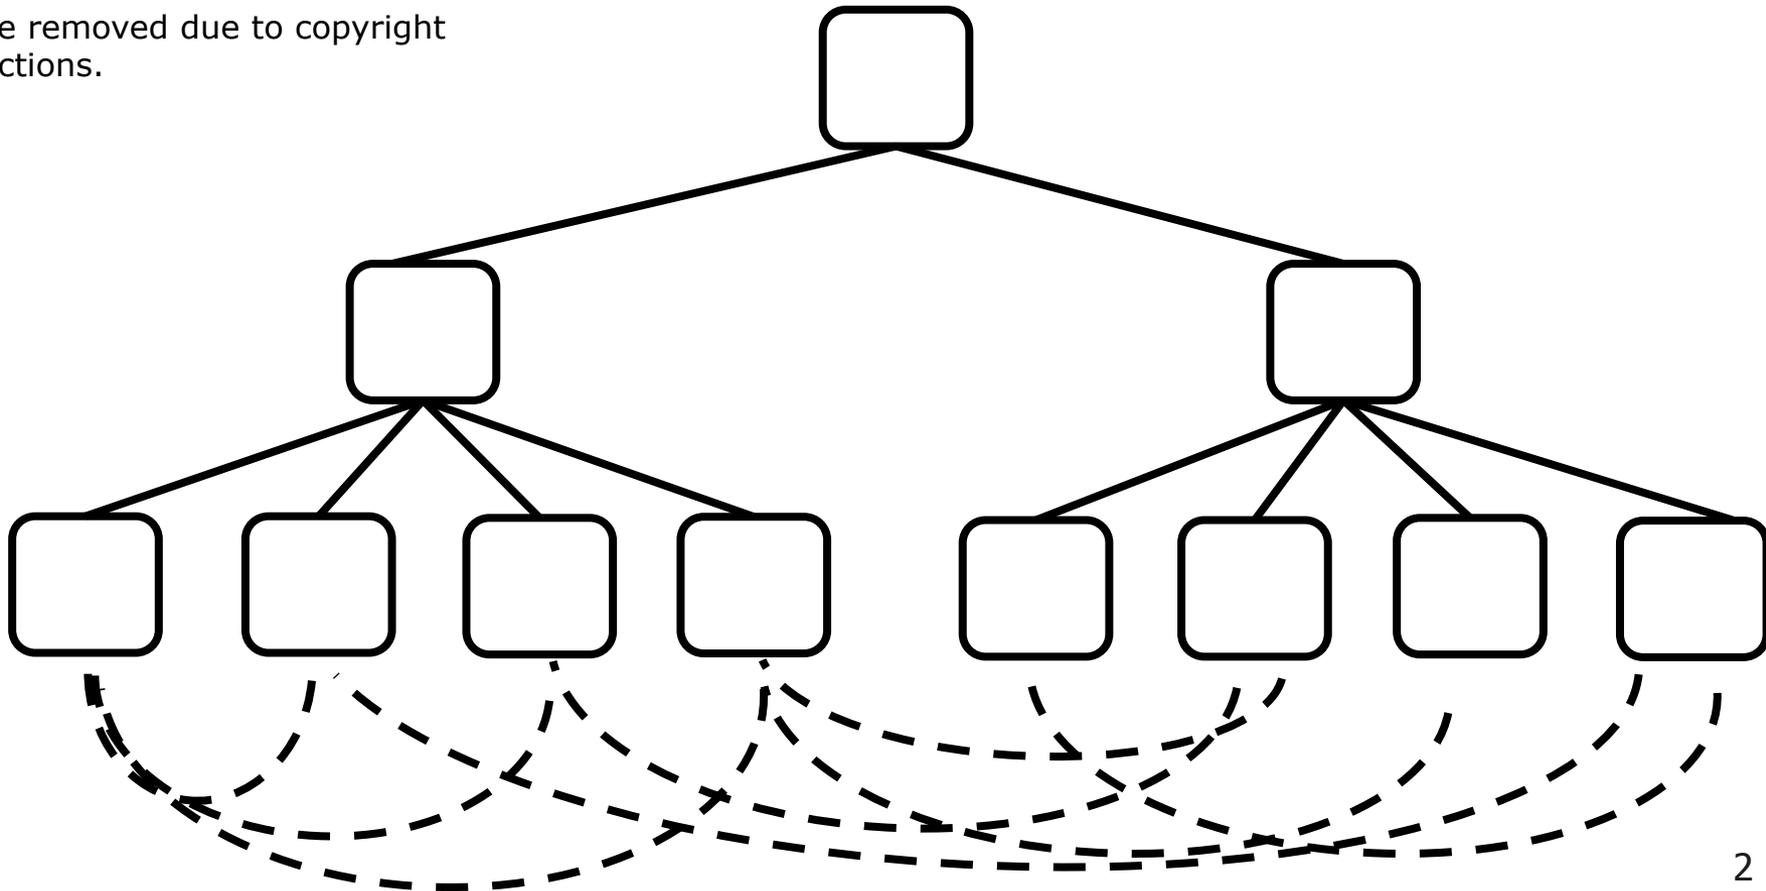

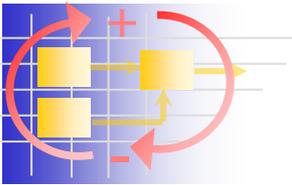

Organization Architecture

People Relationships

Guiding principles of design and evolution

Image removed due to copyright restrictions.

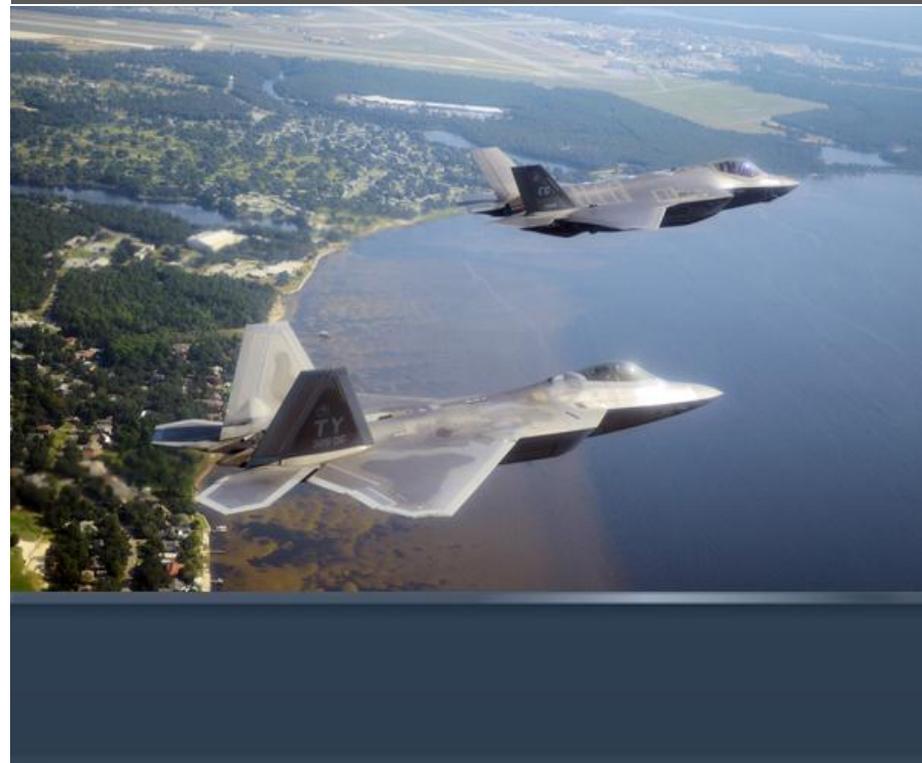

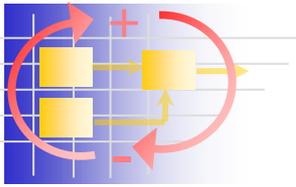

Organization Architecture

AMF Bowling – a leading designer and manufacturer of bowling equipment: pin spotters, ball returns, scoring equipment

Pratt & Whitney – a world leader in the design, manufacture and service of aircraft engines, industrial gas turbines and space propulsion systems.

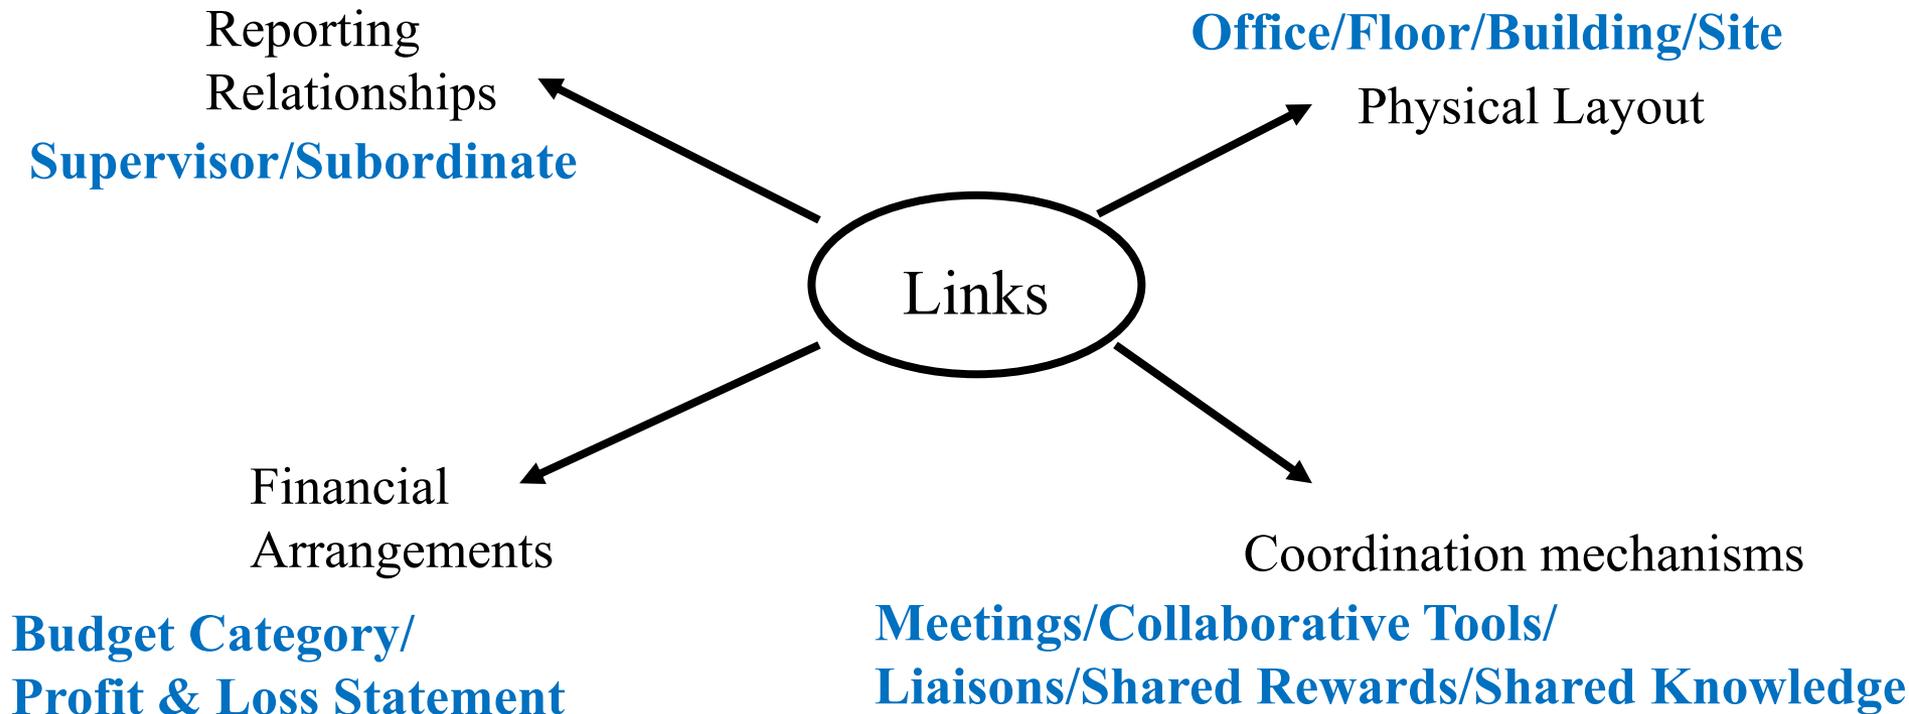

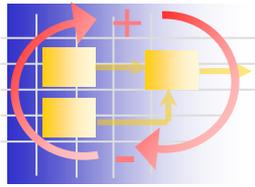

Project Organizations

Project organization is the **scheme** by which individuals designers and developers are **linked** together into **groups**

Organizations are formed by establishing **links** among individuals

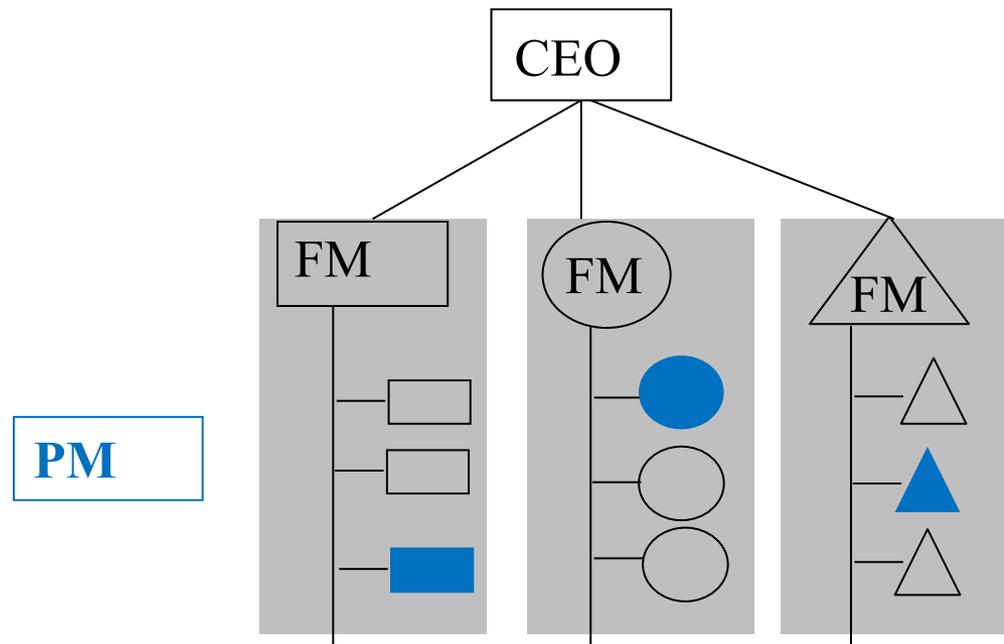

Classical Project Organizations

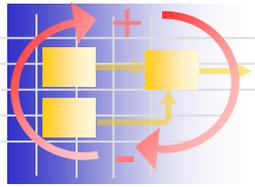

Influence (Functional) Project Organization

Weakest form of project organization

“Functional” organization, workers are “on loan” to project

Project coordinator, but has no budget or tasking authority

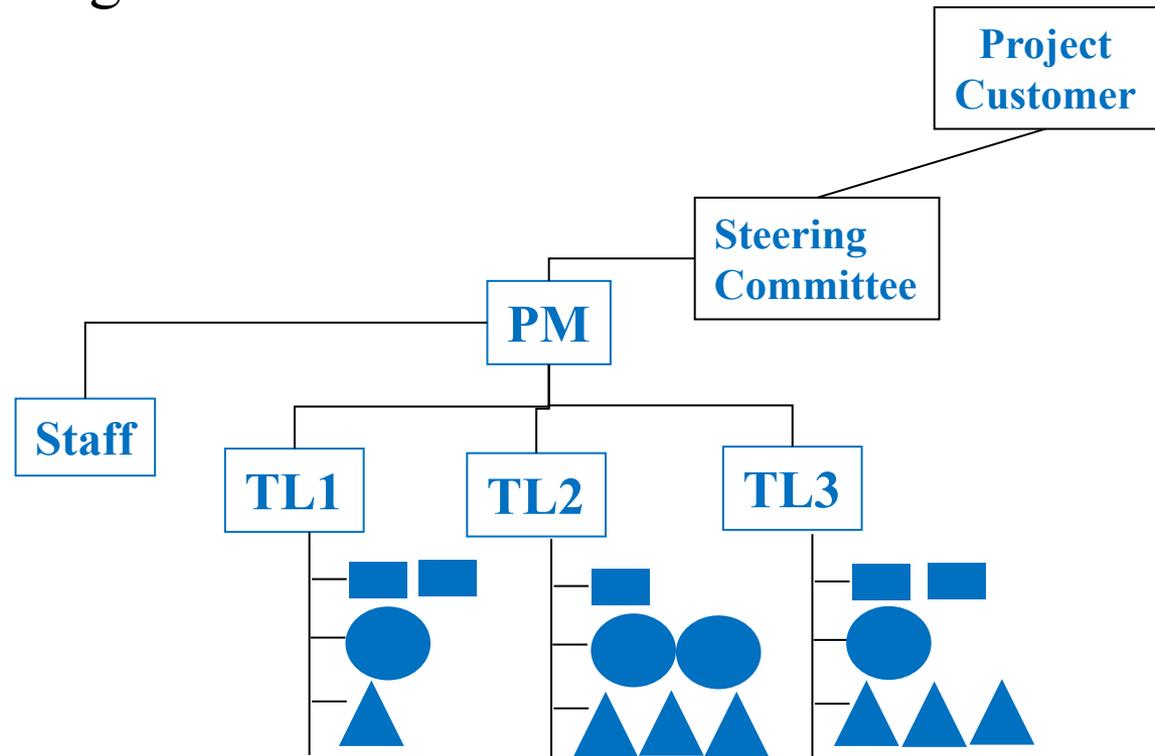

Classical Project Organizations

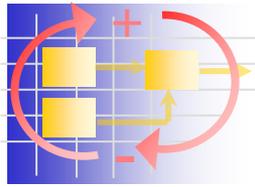

Dedicated Project Organization

Team members work 100% for the project

Empowered project manager

Organizationally recognized unit for a certain time

Classical Project Organizations

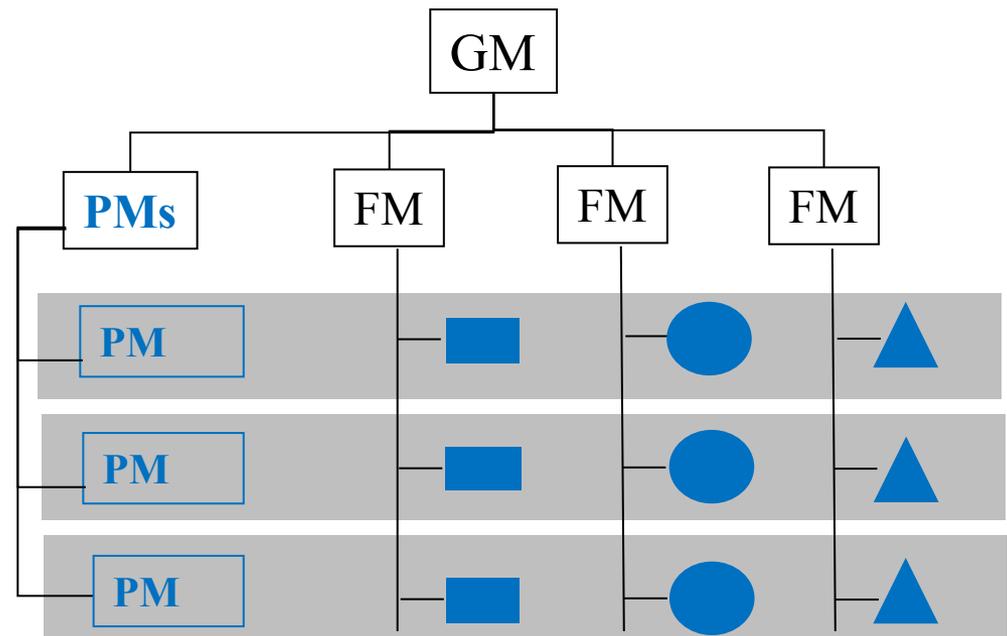

Matrix Organization

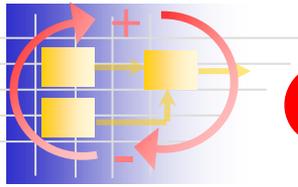

Project manager has tasking and budget authority

Line manager has functional authority, promotions

Team members remain in their functional organizations (have 2 bosses)

Potential for conflicts

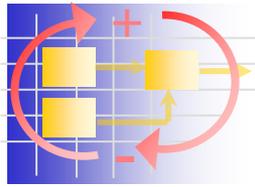

Concept Question 1

Which type of project organization are you most familiar with or have you spent most of your career in?

- Dedicated Project Organization
- Matrix Organization
- Influence (Functional) Organization
- None of the above

Comparison of Project Organizations

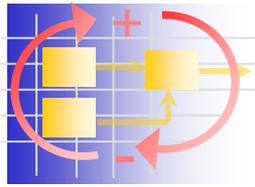

Influence (Functional) Project Organization

Strengths: no org change, one person participates in multiple projects, in-depth expertise, low bureaucracy, easy post-project transition

Weaknesses: slow response time, poor integration, lack of focus, lack of ownership

Examples: customization development (custom motors, bearings, packaging)

Major issues: how to integrate different functions

Comparison of Project Organizations

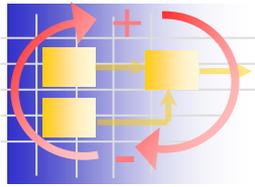

Matrix Organization

Strengths: efficient use of resources, resource flexibility, easier post-project transition, strong project focus

Weaknesses: conflicts between functional (line) managers and PM, resource contention, stressful (at least two bosses)

Examples: automobile, electronics, aerospace companies

Major issues: how to balance functions and projects;
how to evaluate simultaneously project & functional performance

Comparison of Project Organizations

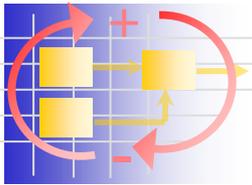

Dedicated Project Organization

Strengths: uniform dedication towards project goals, fast, motivation & cohesiveness, cross-functional integration

Weaknesses: “projectitis”, limited technological expertise, expensive, recruitment difficult, difficult post-project transition,

Examples: start-up companies, “tiger teams”, “skunk works”, firms working in extremely dynamic environment

Major issues: how to maintain functional specialization over product generation
how to share technical learning from one project to another

Project Organization Selection

Influence PO

Matrix PO

Dedicated PO

Scope
(# tasks)

- small

- medium

- large

Duration
(# years)

- short ($\ll 1y$)

- medium

- large ($>2y$)

Uniqueness
(# similar proj.)

- small

- neutral

- one-of-a-kind

Complexity
(#dependencies)

- low

- medium-high

- very complex

Ambitiousness
(prob. of success)

- easy success

- achievable

- challenging

Significance
(for company)

- low priority

- important

- live-or-die

Risk
(impact of failure)

- small

- depends

- large

Cost
(total budget)

- $<M\$1$

- $M\$1-100$

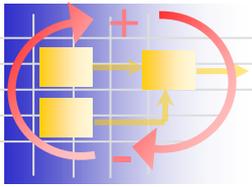

- $\gg M\$100$

Simultaneity
(# concurrent proj)

- many

- a few

- very few

Project Organization Selection

An image of CHAPARRAL STEEL CO. Logo has been removed due to copyright restrictions.

The second largest producer of structural steel beams in North America (acquired by Gerdau Ameristeel in 2007).

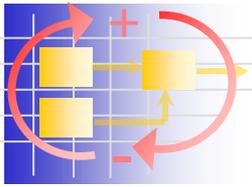

Classifies projects into three categories: **advanced development**, **platform**, and **incremental**

Typically, Chaparral has 40-50 projects underway:

1 or 2 are advanced projects

3 to 5 are platform projects

remainder are small, incremental projects

Project Organization Selection

An image of AMF Logo has been removed due to copyright restrictions.

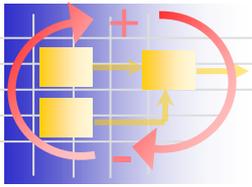

A leading designer and manufacturer of bowling equipment: pin spotters, ball returns, scoring equipment

AMF chose to organize its PD staff in a **matrix structure**

The functions involved in PD are: engineering, manufacturing, marketing, sales, purchasing, quality assurance

The AMF matrix organization is closest to the **weak project organization**

Project managers are not typically the most senior managers in the division; thus, do not have direct control of resources and staffing

Project Organization Selection

An image of AMF Logo has been removed due to copyright restrictions.

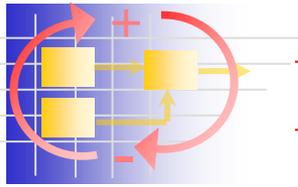

With weak project organization the assignment of staff to **smaller projects** and the balancing of workload within a function are more easily accomplished

AMF is a very **lean company**. The Capital Equipment Division has fewer than 100 salaried employees generating and supporting sales of over \$100 million per year

Everyone works in the same building;

Employees earn substantial financial rewards when the Division is highly profitable;

Members of project teams are motivated to look beyond their own functions, and work together to develop successful products

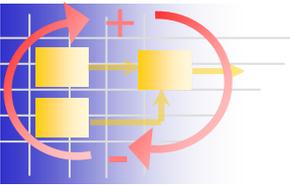

Project Organization Selection

An image of AMF Logo has been removed due to copyright restrictions.

The **engineering manager** works daily to ensure that the appropriate coordination occurs, for example, between marketing and engineering

The **senior management** places emphasis on PD and **encourages effective teamwork**;

The **general manager** devotes several days each month to **monitoring the progress of projects**

Project Organization Selection

General Motors
Powertrain
Division

Design
small-block
V8 engine

22 PDTs

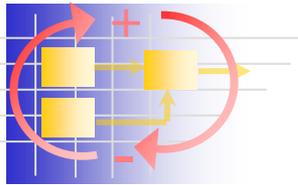

- Engine Block
- Cylinder Heads
- Camshaft/Valve Train
- Pistons
- Connecting Rods
- Crankshaft
- Flywheel
- Accessory Drive
- Lubrication
- Water Pump/Cooling
- Intake Manifold
- Exhaust
- E.G.R.
- Air Cleaner
- A.I.R.
- Fuel System
- Throttle Body
- EVAP
- Ignition System
- Electronic Control Module
- Electrical System
- Engine Assembly

PDT composition

- 1 product release engineer
- 1 CAD designer
- 3 manufacturing engineers
- 2 purchasing representatives
- 2 casting engineers
- machine tool supplier
- 1 production control analyst
- 1 financial planner
- production personnel

Image of Corvette engine removed due to copyright restrictions.

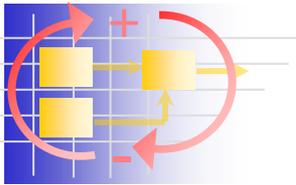

Image of V8 engine animation removed due to copyright restrictions.

Data Collection

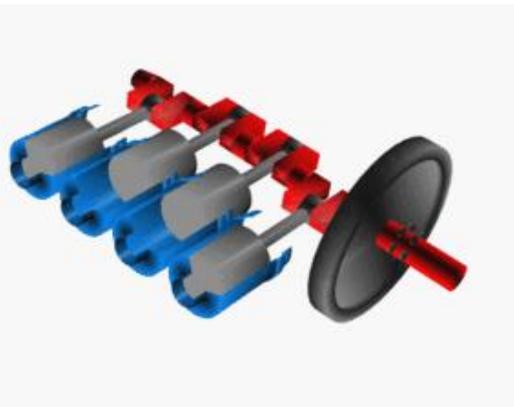

How often do you need to share technical information with the other PDTs in order to complete the technical tasks of your PDT?

<u>PDT</u>	<u>Daily</u>	<u>Weekly</u>	<u>Monthly</u>	<u>Never</u>

Proposed System Teams

Development Organization: P&W 4098 Jet Engine

UNITED TECHNOLOGIES
PRATT & WHITNEY

Courtesy of United Technologies.
Used with permission.

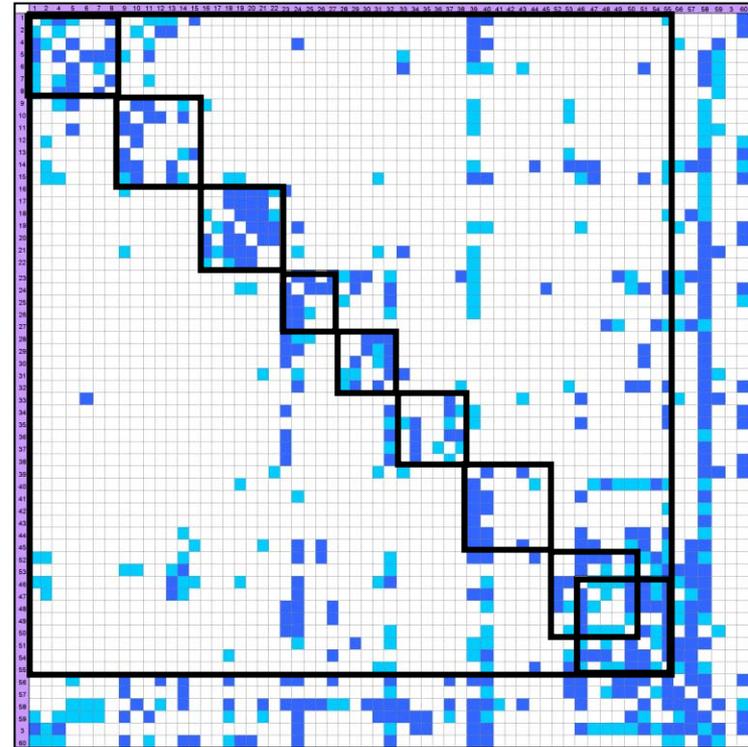

60 design teams clustered into 10 groups.

Reported interactions took place during the detailed design period of the product development process.

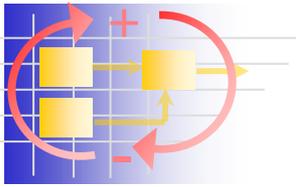

Design executed concurrently.

Six system integration teams {

- Low intensity interaction (0 to 5 scale)
- High intensity interaction (0 to 5 scale)

Team Interactions

Product Development Principles

‘Iteration’

Changes and rework propagate through the design network.

‘Parallelism’

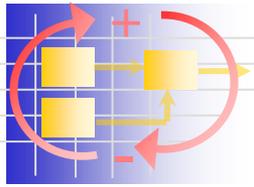

Large development efforts require multiple activities to be performed in parallel.

‘Decomposition & Integration’

Splitting a complex system into sub-systems and combining them

‘Stability’

The total number of design problems eventually falls below an acceptable threshold within a specified time frame

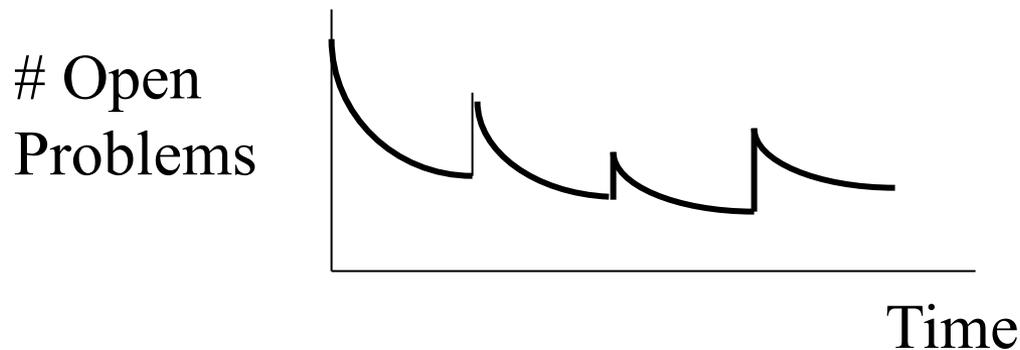

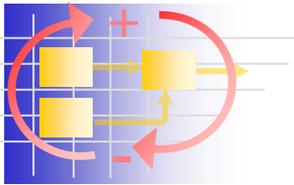

The Design Churn Phenomenon

The oscillatory nature of PD: development tasks (thought to be finished) reappear or repeat

Design Churn:

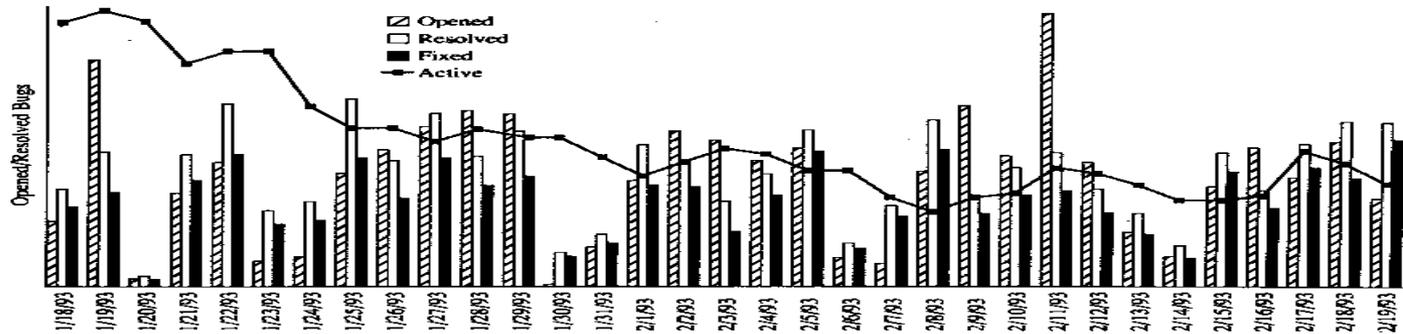

“a scenario where the total number of problems being solved does not reduce monotonically as the project evolves over time”

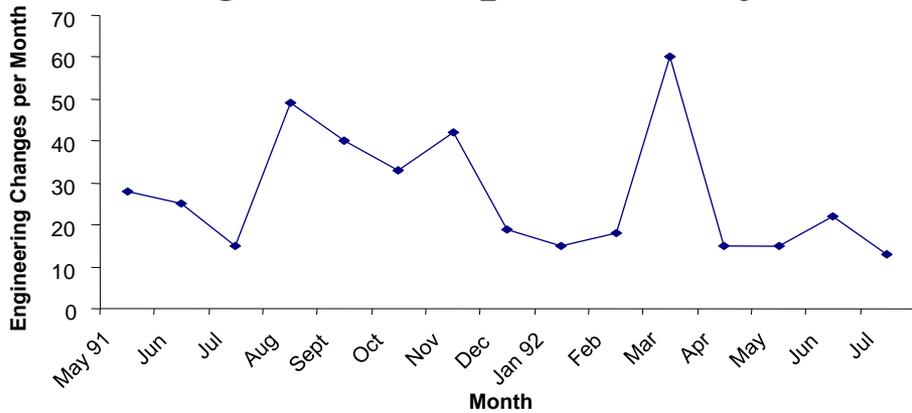

Examples of Churn

Bug Data and Daily Builds from Excel 5.0. Milestone 2

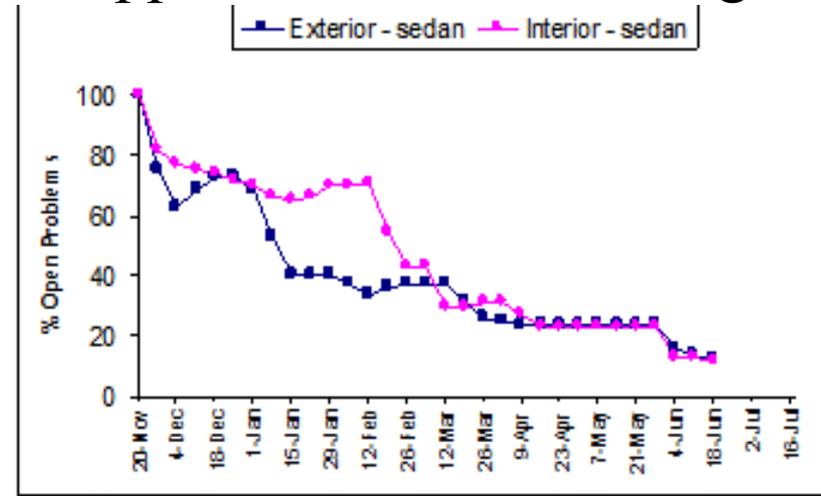

Source: Cusumano & Selby. Microsoft Secrets. Free Press, 1995

Engineering Changes in a Stereo Integrated Amplifier Project

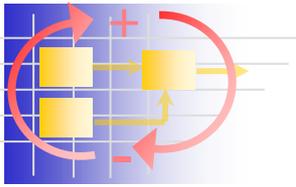

Source: Weelwright & Clark. Revolutionizing Product Development. Free Press, 1992.

Appearance Vehicle Design

Source: Yassine, Joglekar, Braha, Eppinger & Whitney. Research in Engineering Design. Vol. 14. 2003. pp. 145-161.

Potential Sources of Churn

Exogenous

Changes in design objectives (management directives, requirement changes)

Performance variability/uncertainty

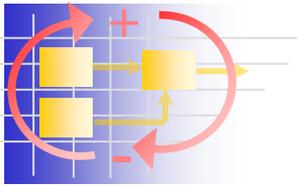

Oscillatory resource allocation (firefighting)

Endogenous

Product architecture – interdependencies

System/local decomposition

Feedback delays – information hiding

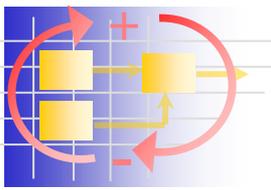

Why is Churn Bad?

Myopic resource allocation decisions

Elongated PD time

Organizational memory lapses

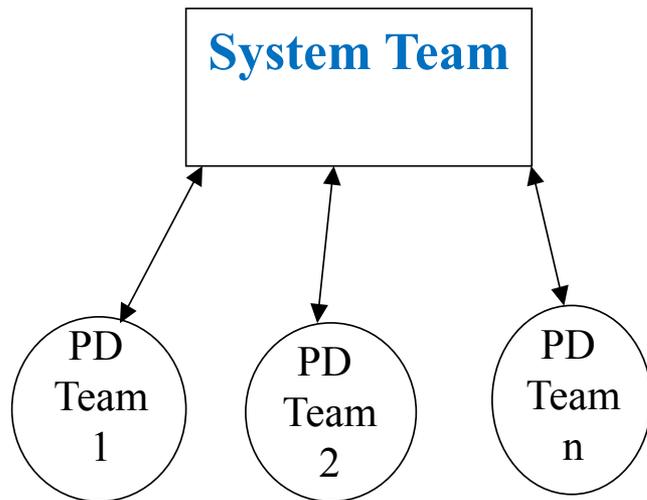

Frustration and deteriorated morale

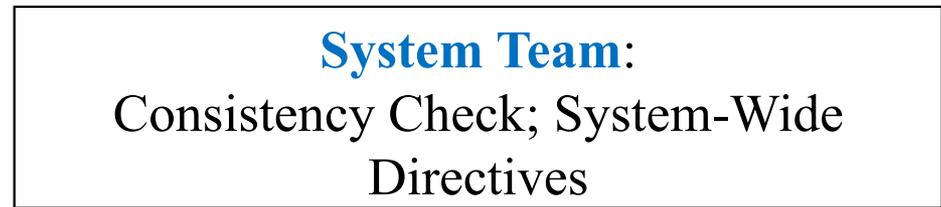

System/Local Decomposition & Information Hiding

Decomposition of development into local and system tasks leads to information hiding which results in churn

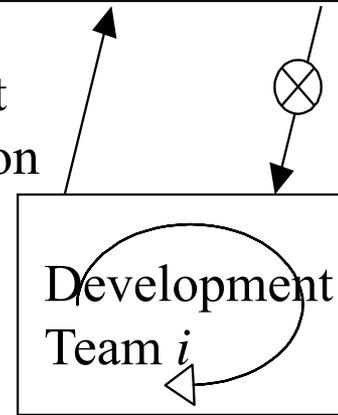

Testing & Integration

Local Teams

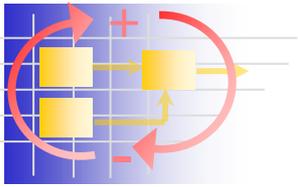

Frequent Information Update

Intermittent System Feedback

Local Team

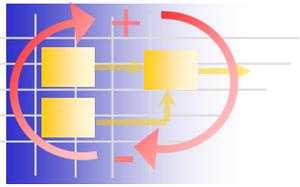

Numerical DSMs

	Task A	Task B	Task C
Task A	0.6		0.4
Task B	0.2	0.7	
Task C		0.7	0.2

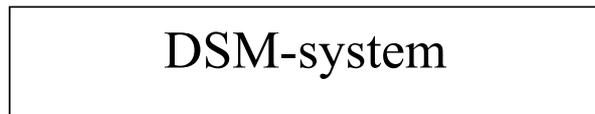

Numbers along the diagonal are the rate of problem solving per unit time: 0 \rightarrow 100%

Off-diagonal numbers are dependency strengths between tasks: 0 \rightarrow 100%

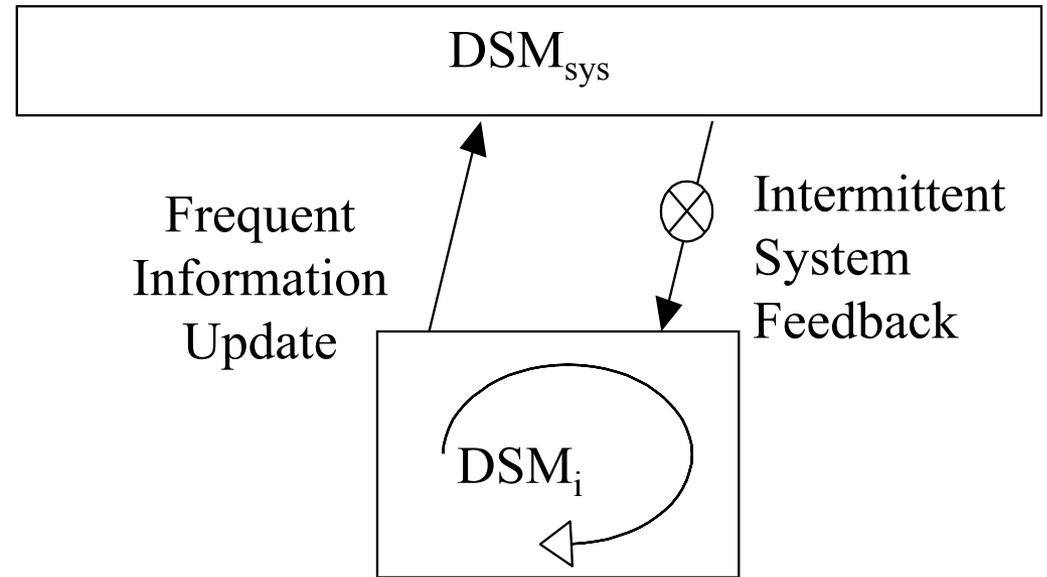

System/Local DSMs

System Team

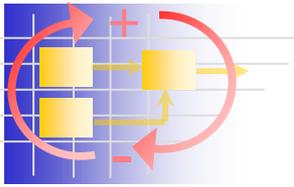

Local Teams

System Team

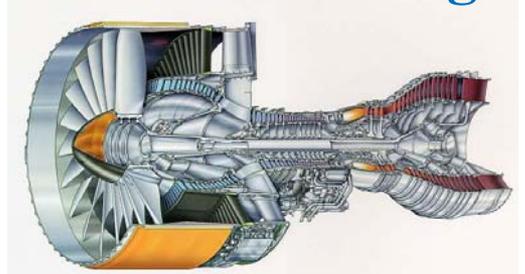

Local Team

Several DSMs (Local & System) with at least one unit of time of delay for information exchange

DSM Representation

m local DSMs & a single System DSM

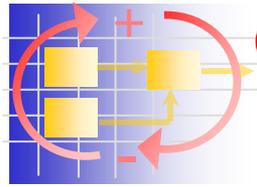

How Does Decomposition/Integration Affect Performance Dynamics?

Given a local DSM, system DSM, and a choice of information update frequency, what are the conditions under which:

Design churn occurs?

Convergence of development is guaranteed?

Case Study: Automotive Appearance Design Process

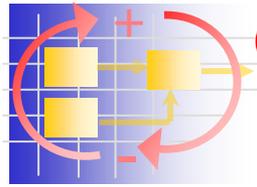

The process of designing all **interior** and **exterior** automobile surfaces for which appearance, surface quality and operational interface is important to the customer

Image removed due to copyright restrictions.

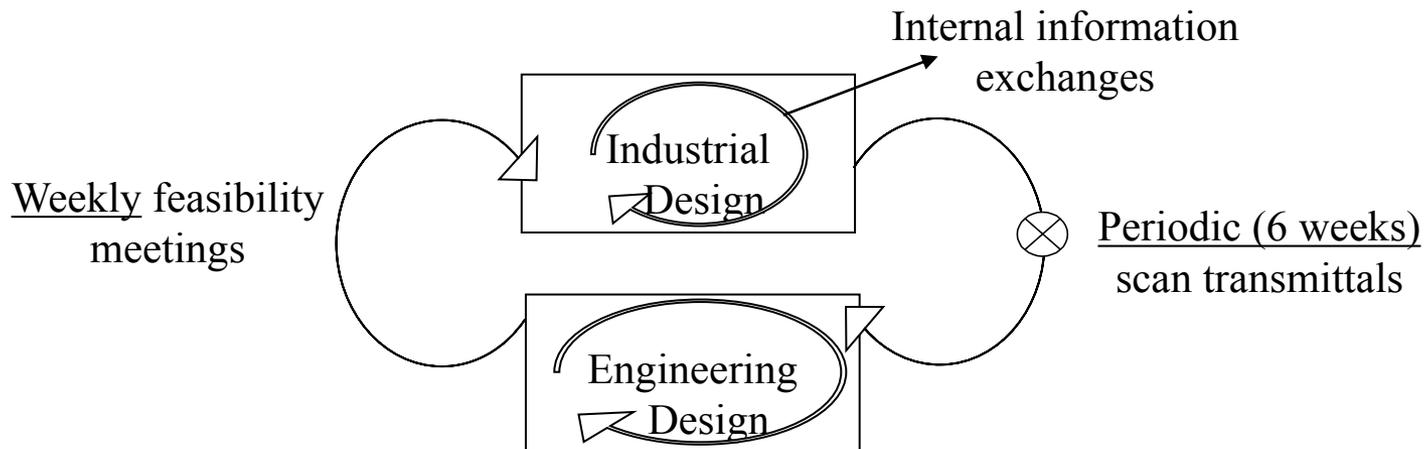

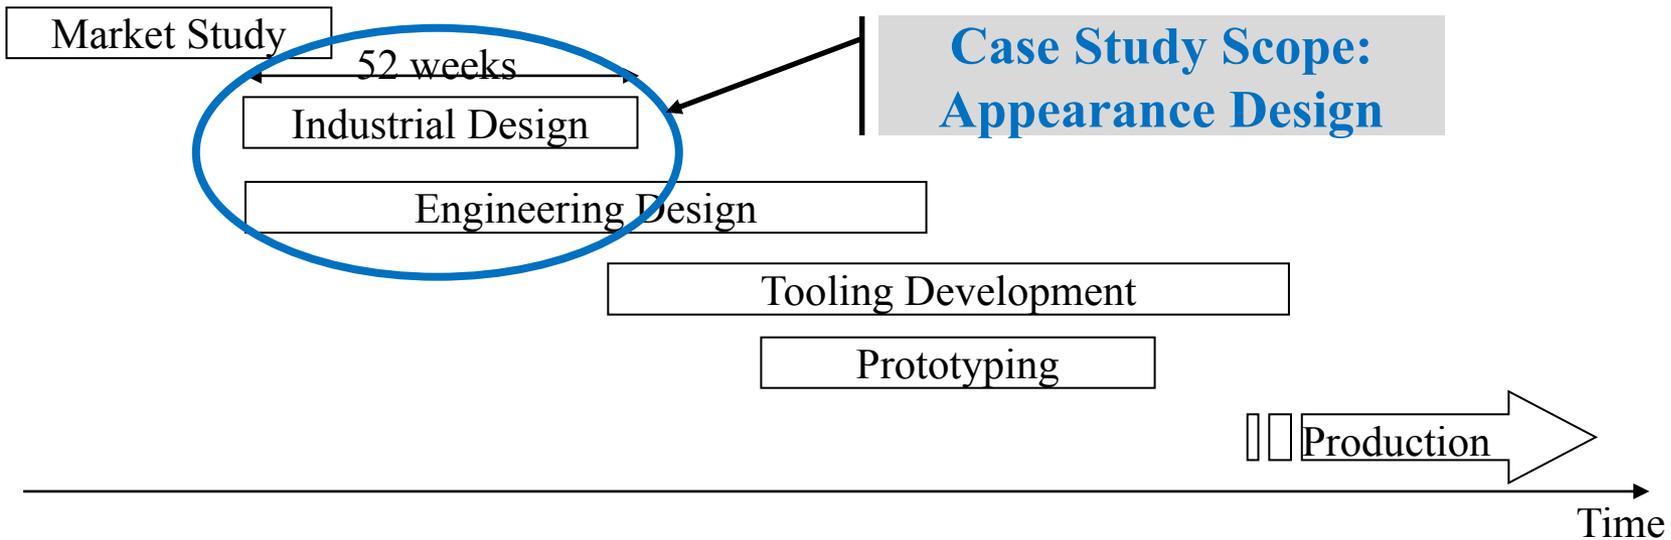

Examples

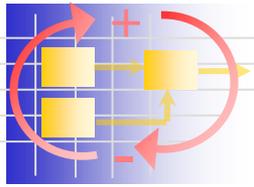

Exterior sheet metal design

Visible interior panels

Summary

Decomposition/Integration

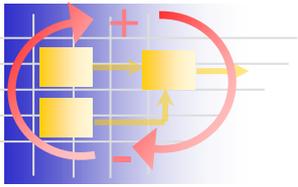

Large development efforts require multiple activities to be performed in parallel

The many subsystems must be integrated to achieve an overall system solution

Organizations can be “designed” based upon this structure

Decomposition/Integration and Dynamics

Design Churn is a fundamental property of a decomposed development process

Summary

Intrinsic Sources of Churn

Interdependency

Concurrency

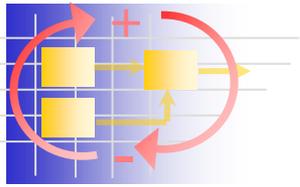

Feedback delays and information hiding

Strategies to mitigate churn

Resource-based strategies

Rework-based strategies

Time-based strategies
