Part II – Quantum Mechanical Methods : Lecture 5

More QM Modeling for Solar Thermal Fuels, Plus a Little H-Storage

Jeffrey C. Grossman

Department of Materials Science and Engineering
Massachusetts Institute of Technology

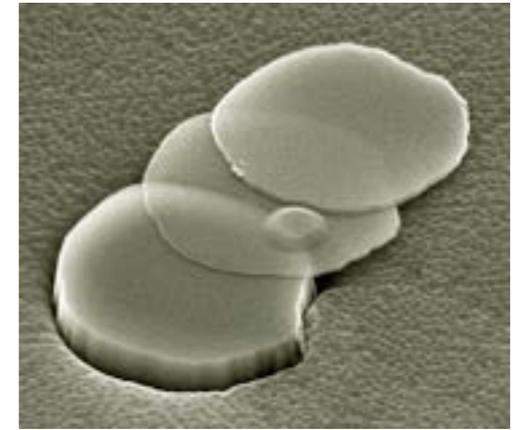

Part II Topics

1. It's a Quantum World: The Theory of Quantum Mechanics
2. Quantum Mechanics: Practice Makes Perfect
3. From Many-Body to Single-Particle: Quantum Modeling of Molecules
4. Application of Quantum Modeling of Molecules: Solar Thermal Fuels
5. Application of Quantum Modeling of Molecules: Hydrogen Storage
6. From Atoms to Solids
7. Quantum Modeling of Solids: Basic Properties
8. Advanced Prop. of Materials: What else can we do?
9. Application of Quantum Modeling of Solids: Solar Cells Part I
10. Application of Quantum Modeling of Solids: Solar Cells Part II
11. Application of Quantum Modeling of Solids: Nanotechnology

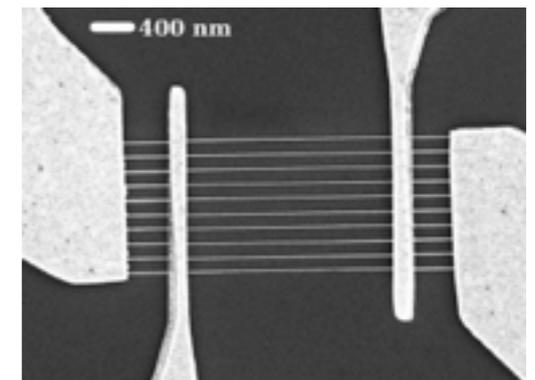

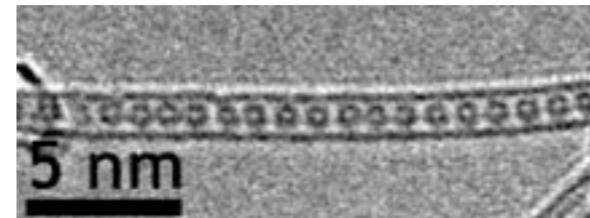

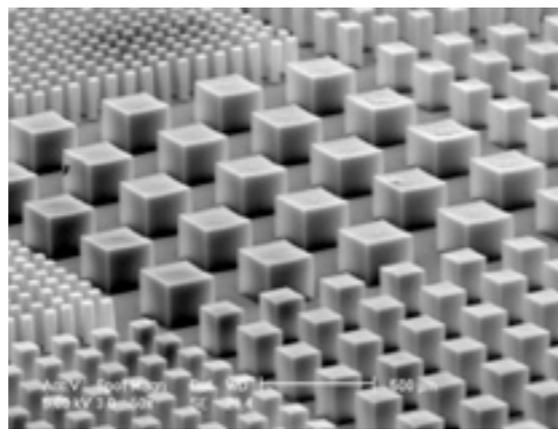

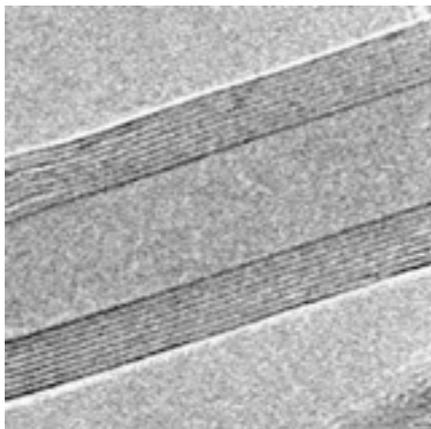

Lesson outline

- Feeling good about energy levels
- Continued discussion of solar thermal fuels
- Interactive calculations and discussion on candidate fuels
- Hydrogen storage

Let's look at a single element:

carbon

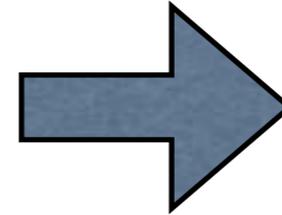

Nanotube architecture © John Hurt; graphene integrated circuit © Raghu Murali; other images © sources unknown. All rights reserved. This content is excluded from our Creative Commons license. For more information, see <http://ocw.mit.edu/help/faq-fair-use/>.

Carbon in Energy to Date

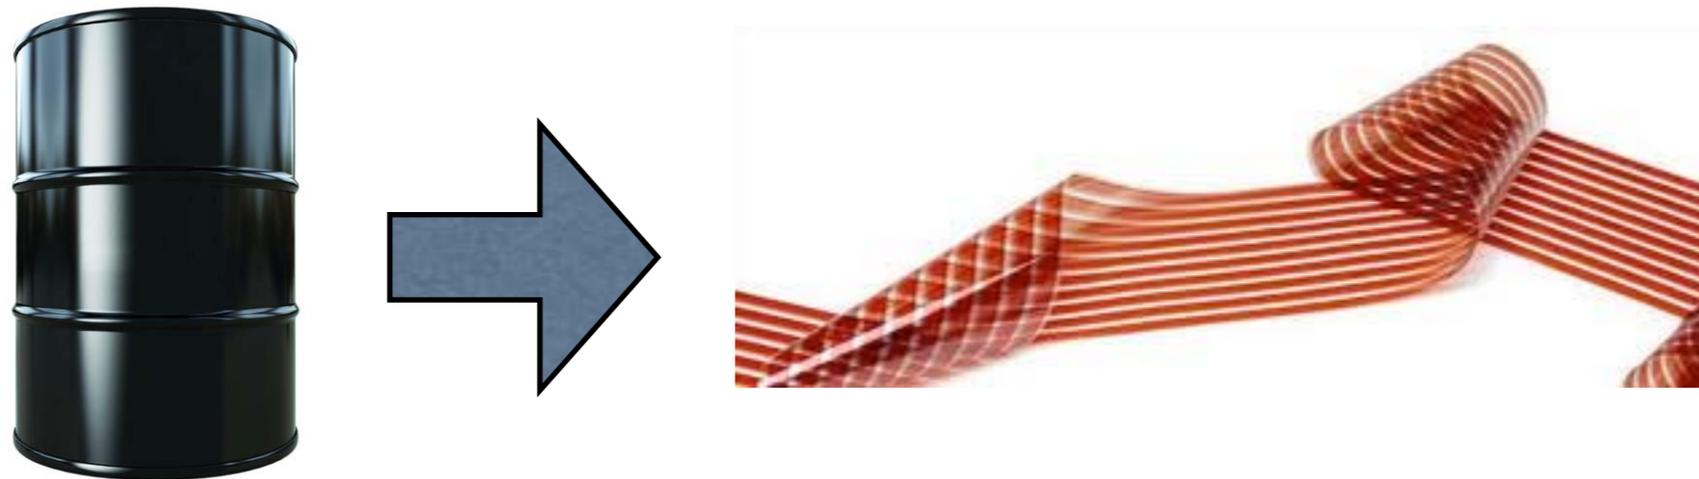

One Barrel of oil
(159 liters) =
1.73 MWh of energy.

Same C: 10^5 X Improvement

That same 1 barrel could be used to make the plastic needed for thin-film solar cells.

© sources unknown. All rights reserved. This content is excluded from our Creative Commons license. For more information, see <http://ocw.mit.edu/help/faq-fair-use/>.

The solar cells could generate ~16,000 MWh of energy over their lifetime, or 10,000 X as much.

Energy Levels and Basis Sets

Let's pause and feel our oneness with these things.

Energy Levels

$$H\psi(\vec{r}) = E\psi(\vec{r})$$

The S. Eq. leads to wavefunctions

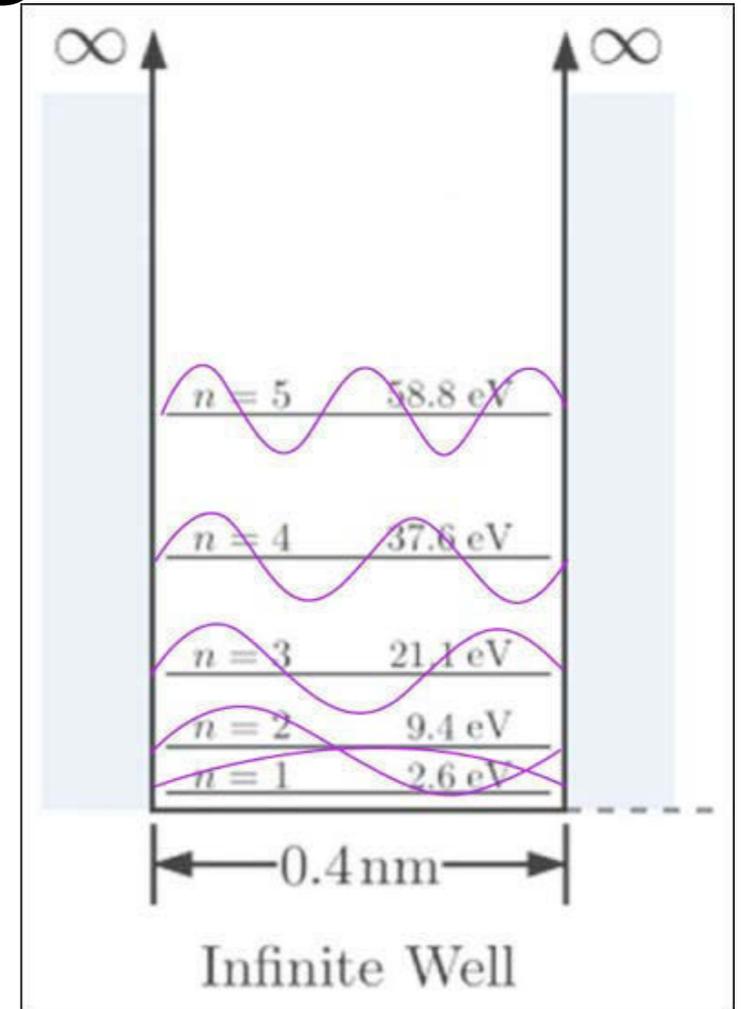

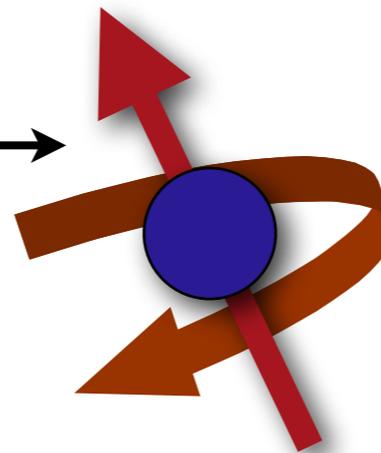

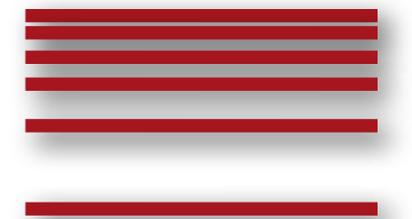

Image adapted from Wikimedia Commons, <http://commons.wikimedia.org>.

Which squared lead to probability distributions

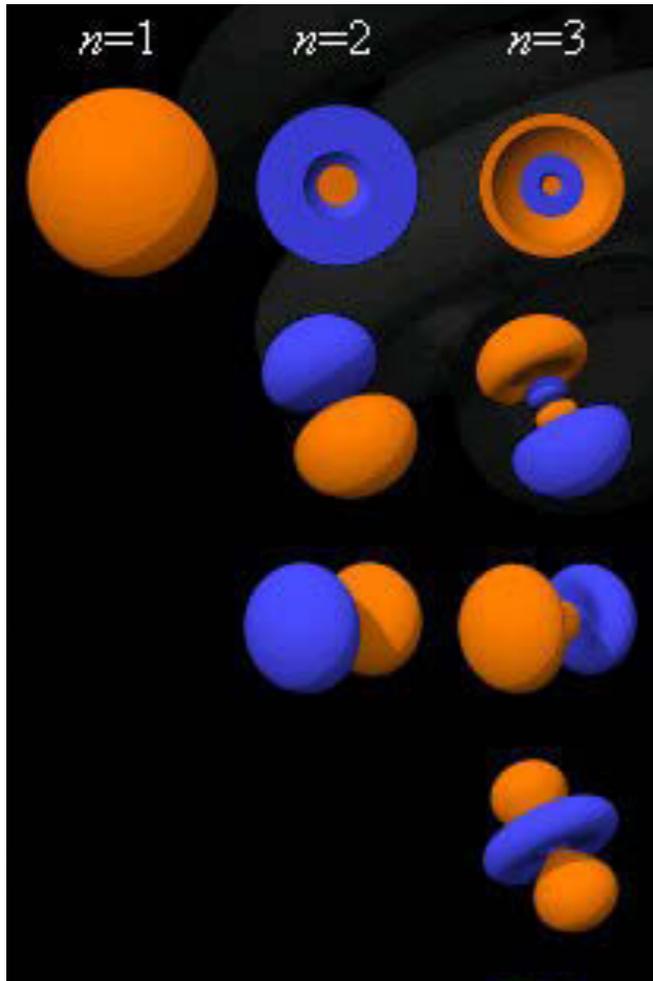

Which once spin is taken into account

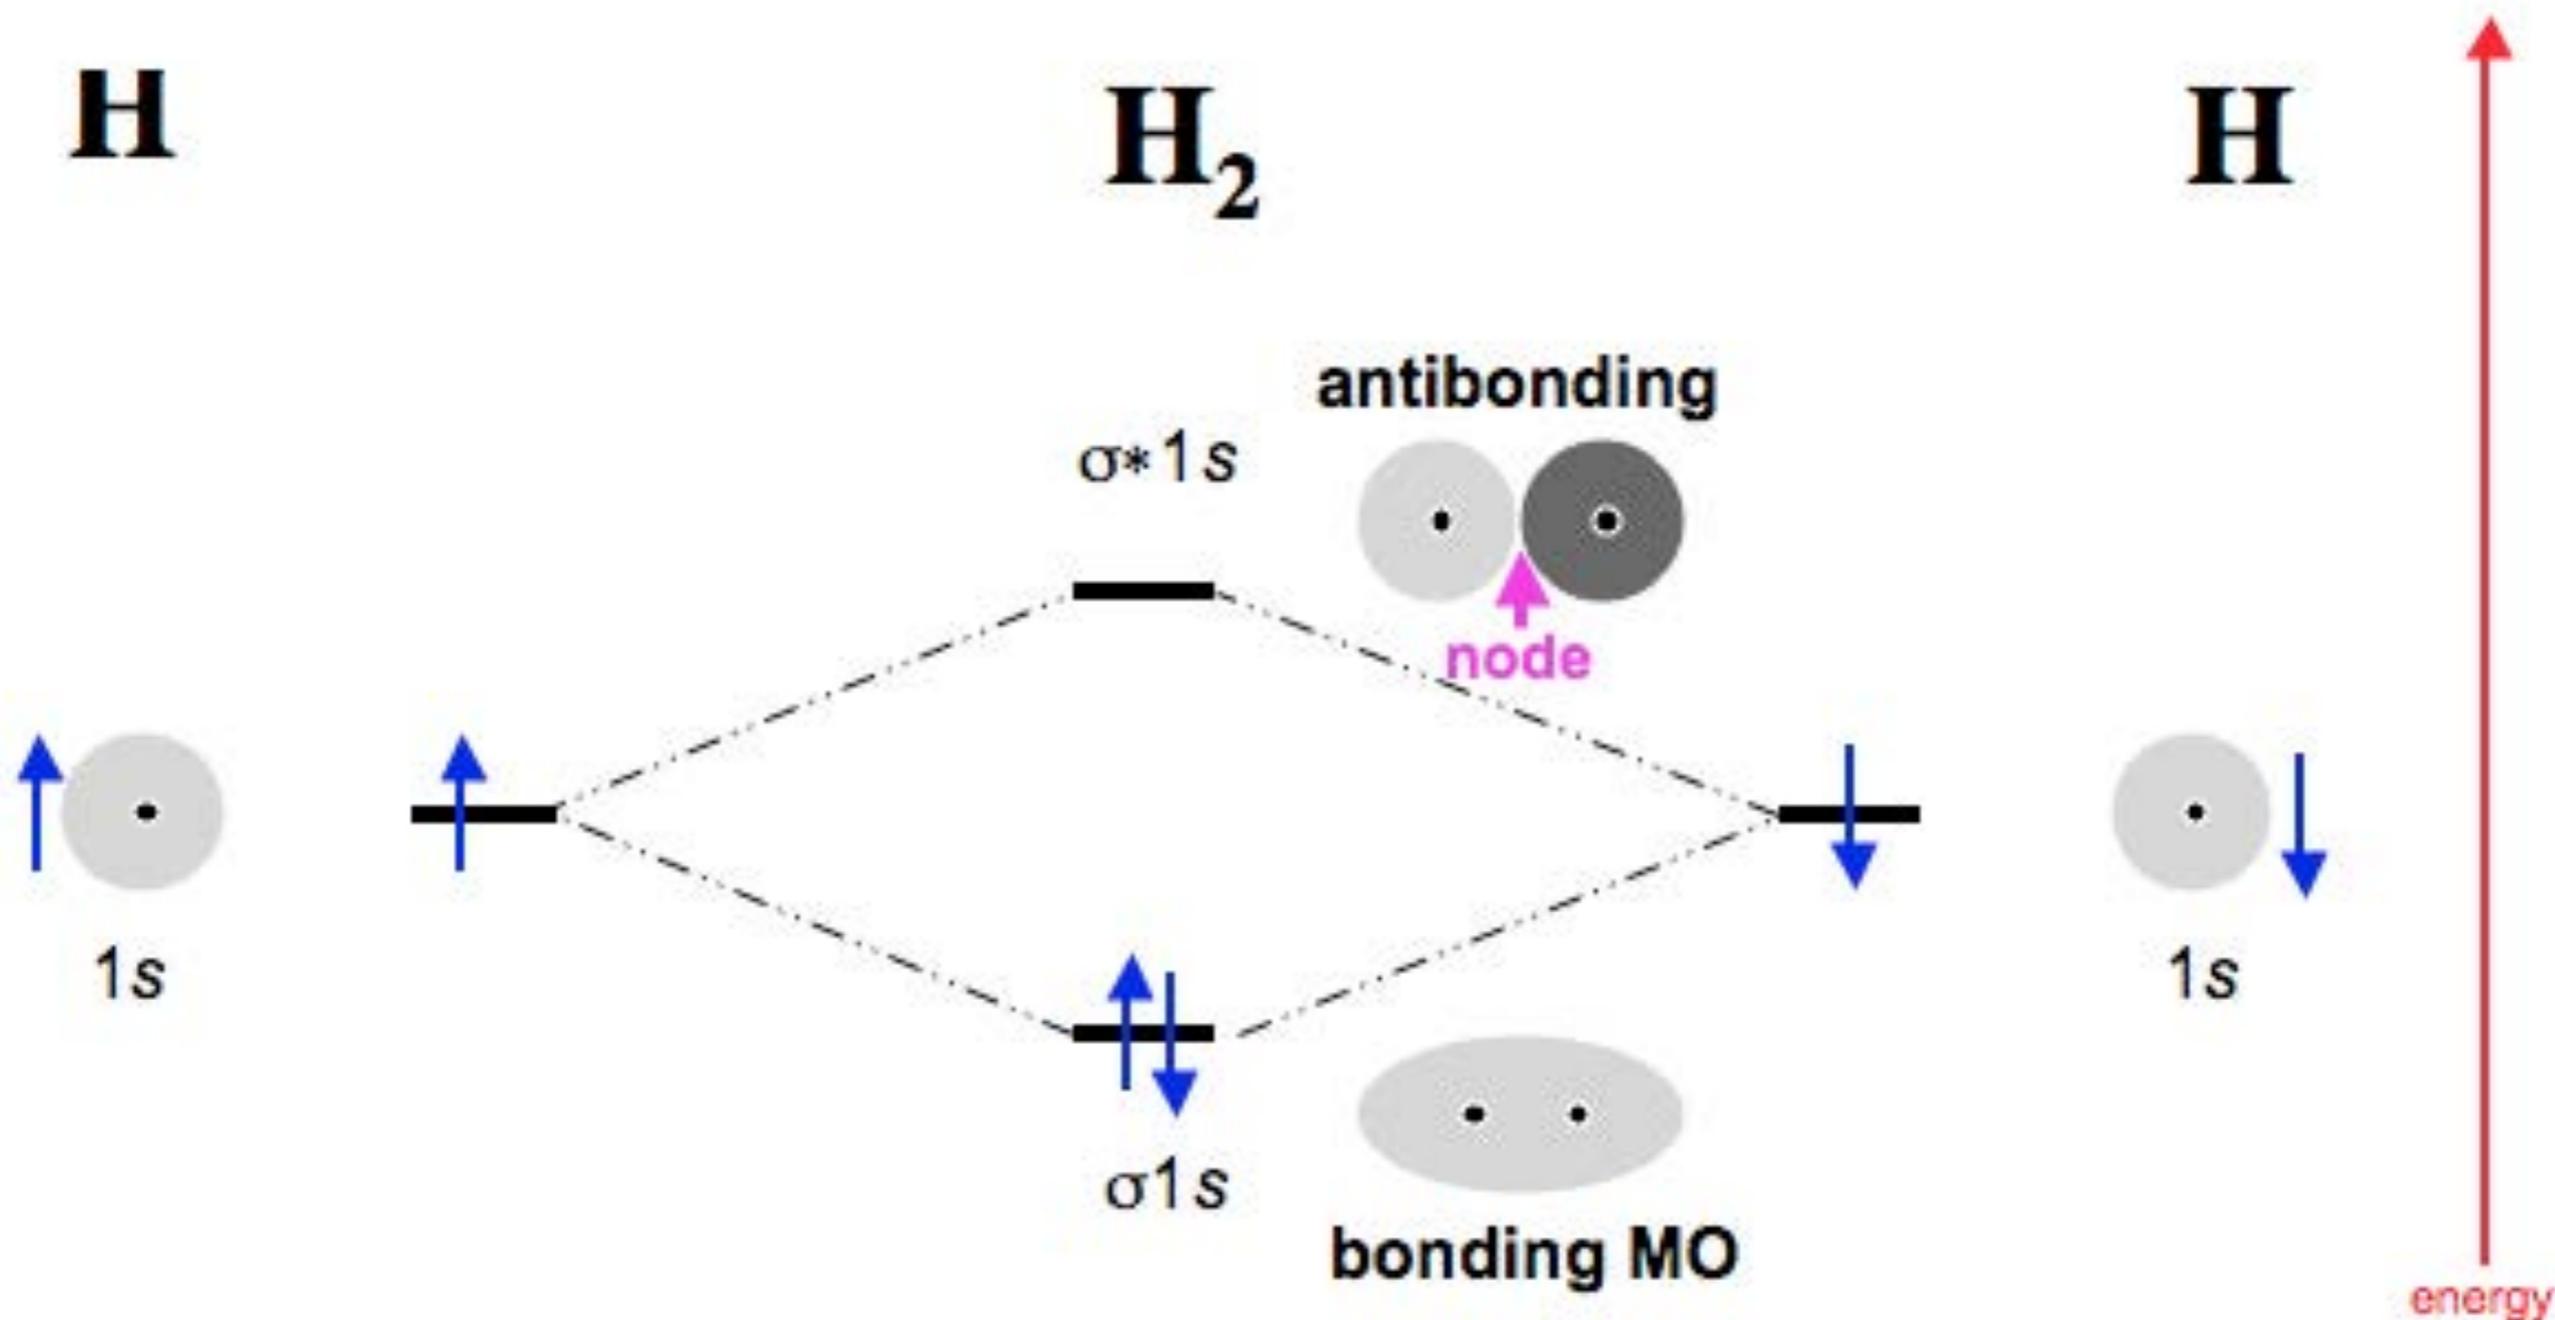

Tells us about energy levels!

$$E_n = \frac{-me^4}{8\epsilon_0^2 h^2} \frac{1}{n^2} = \frac{-13.6\text{eV}}{n^2}$$

Energy Levels

Review: Basis functions

Matrix eigenvalue equation:

$$H\psi = E\psi$$

$$\psi = \sum_i c_i \phi_i$$

expansion in
orthonormalized basis
functions

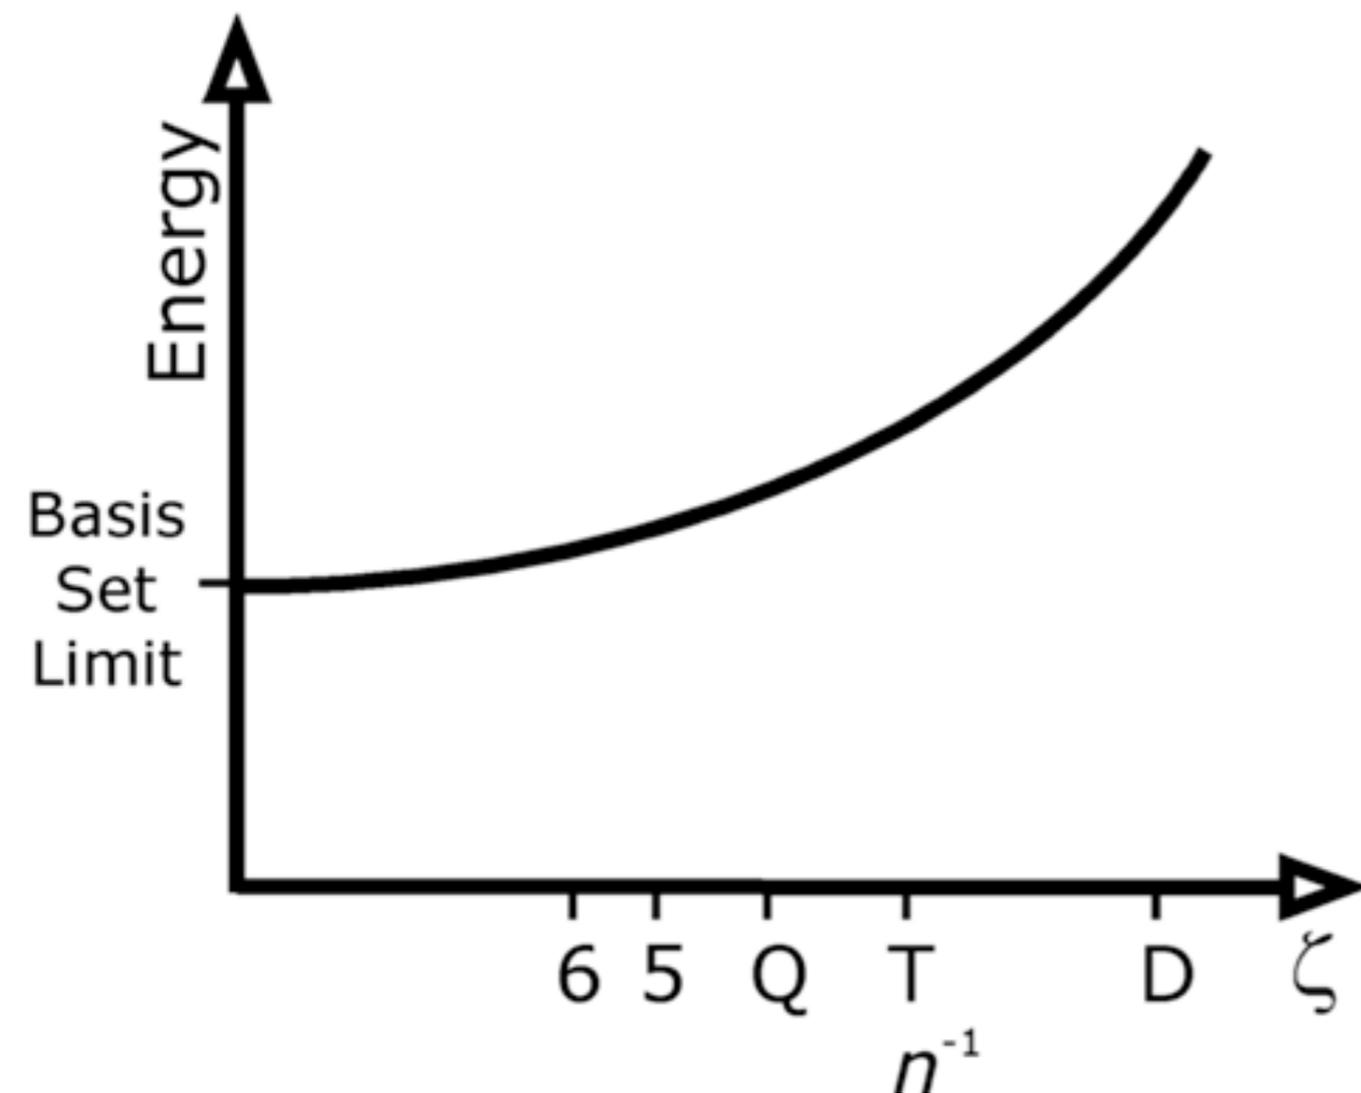

$$H \sum_i c_i \phi_i = E \sum_i c_i \phi_i$$
$$\int d\vec{r} \phi_j^* H \sum_i c_i \phi_i = E \int d\vec{r} \phi_j^* \sum_i c_i \phi_i$$

$$\sum_i H_{ji} c_i = E c_j$$

$$\mathcal{H}\vec{c} = E\vec{c}$$

Basis Set Convergence

When is a basis set converged?

- Many basis sets have been made for different elements.*
- You can make your own one too.
- This can lead to big tables (but chemists love big tables!).

* see, e.g., bse.pnl.gov

Basis Set Convergence

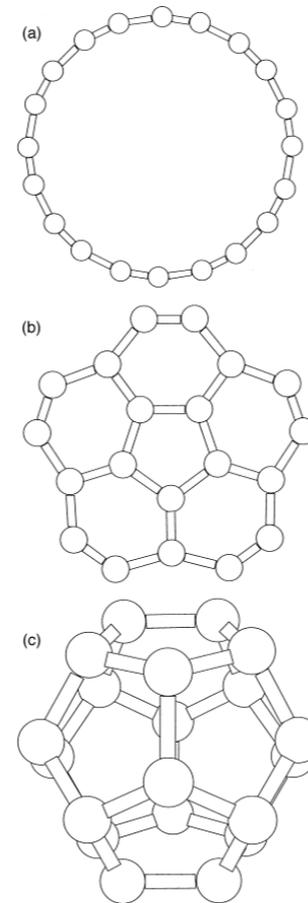

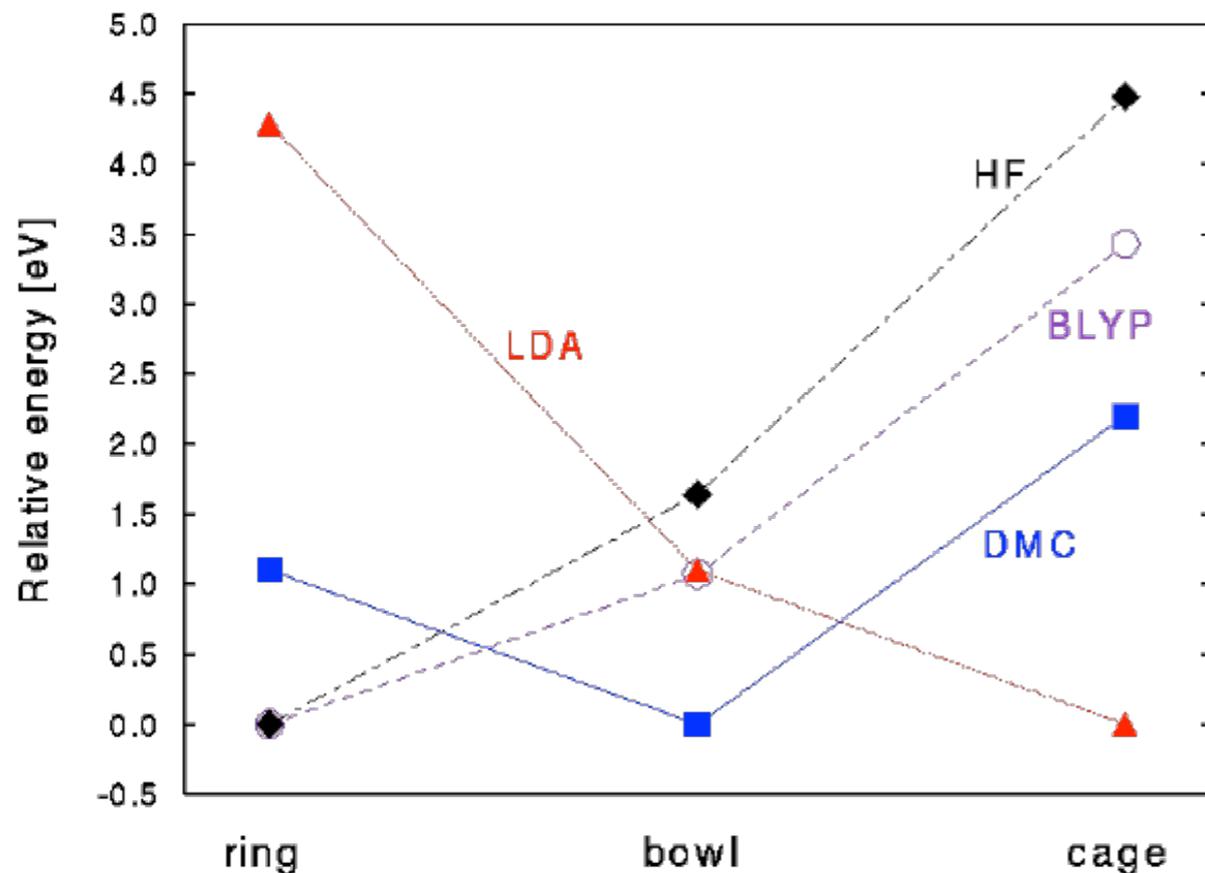

Table 2:

	STO-3G	3-21G	6-31G	6-31G*	6-31G**	6-31++G**	6-311++G(2d,2p)	6-311++G(3df,3pd)	cc-pVDZ	cc-pVTZ	cc-pVQZ	aug-cc-pVDZ	aug-cc-pVTZ	aug-cc-pVQZ	Ave. Error

What else?

After the basis set is converged, is the calculation “right”?

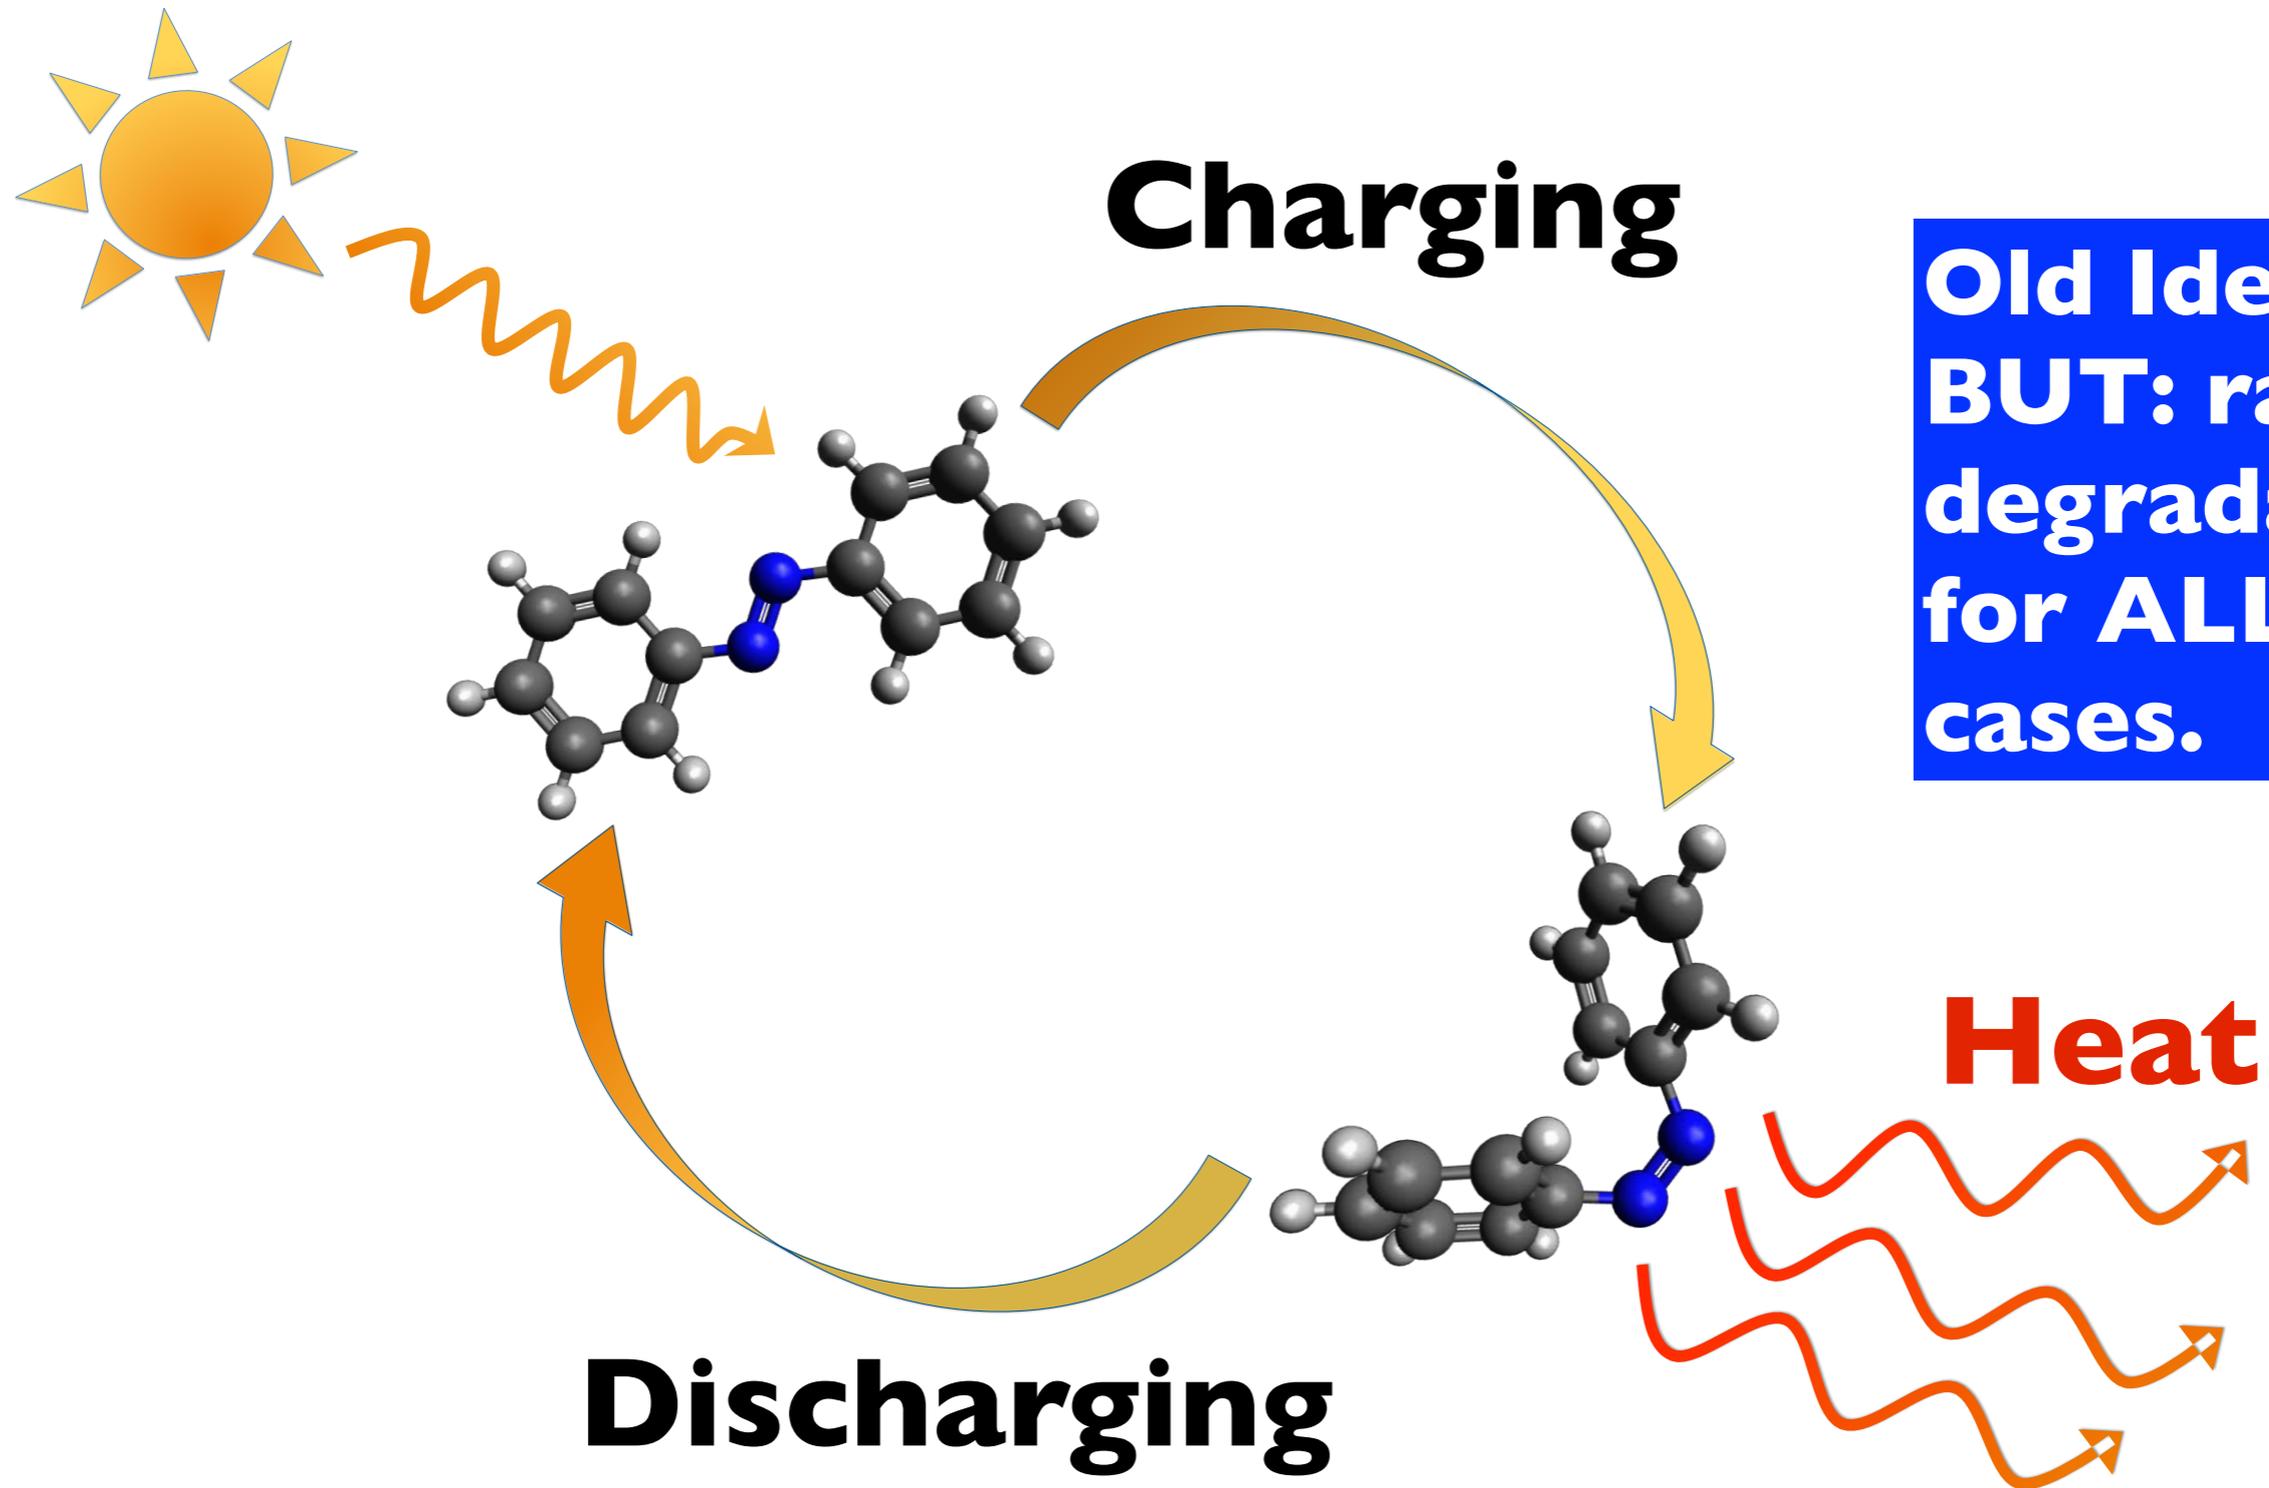

example: what is the most stable structure of 20 carbon atoms?

Hmmmm....

**Back to our first
application example: Solar
Chemical Fuels**

Solar-Chemical : Heat stored in chemical bonds

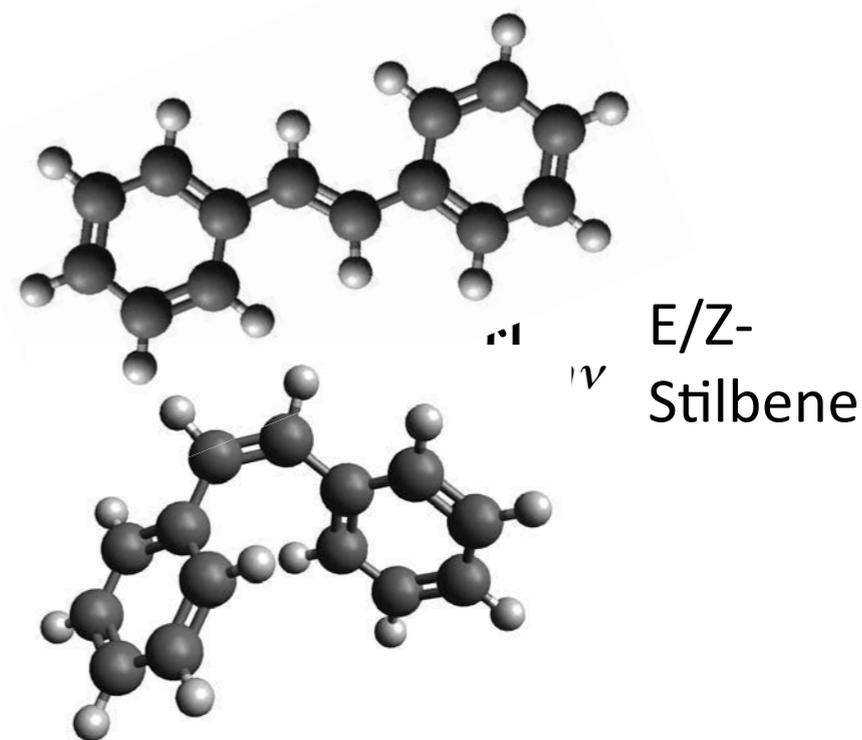

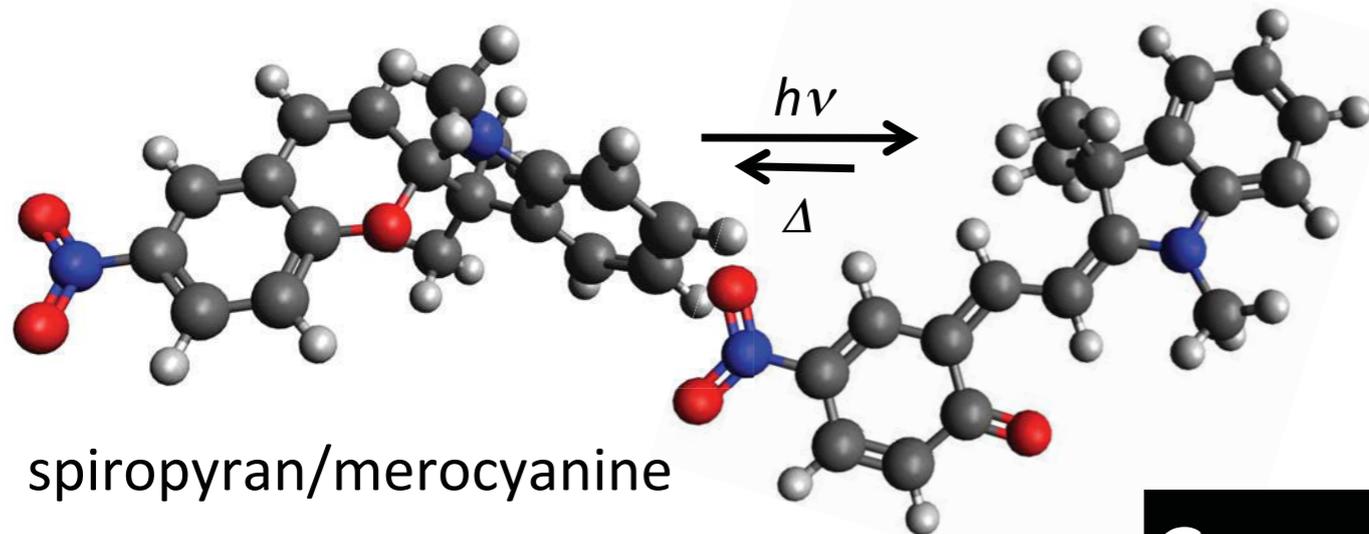

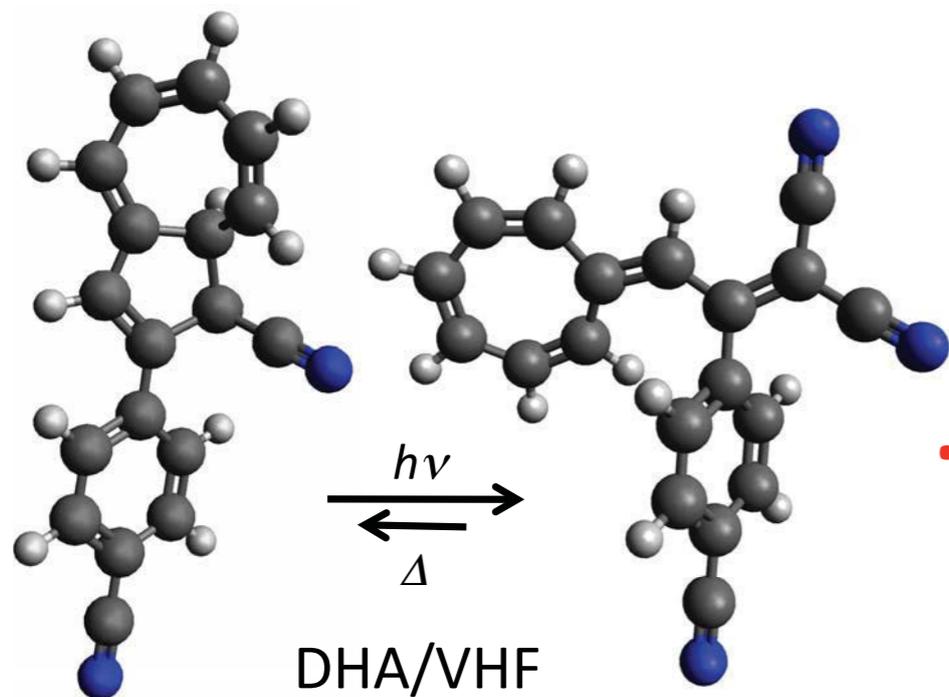

**Old Idea,
BUT: rapid
degradation
for ALL
cases.**

A novel approach to solar thermal fuels

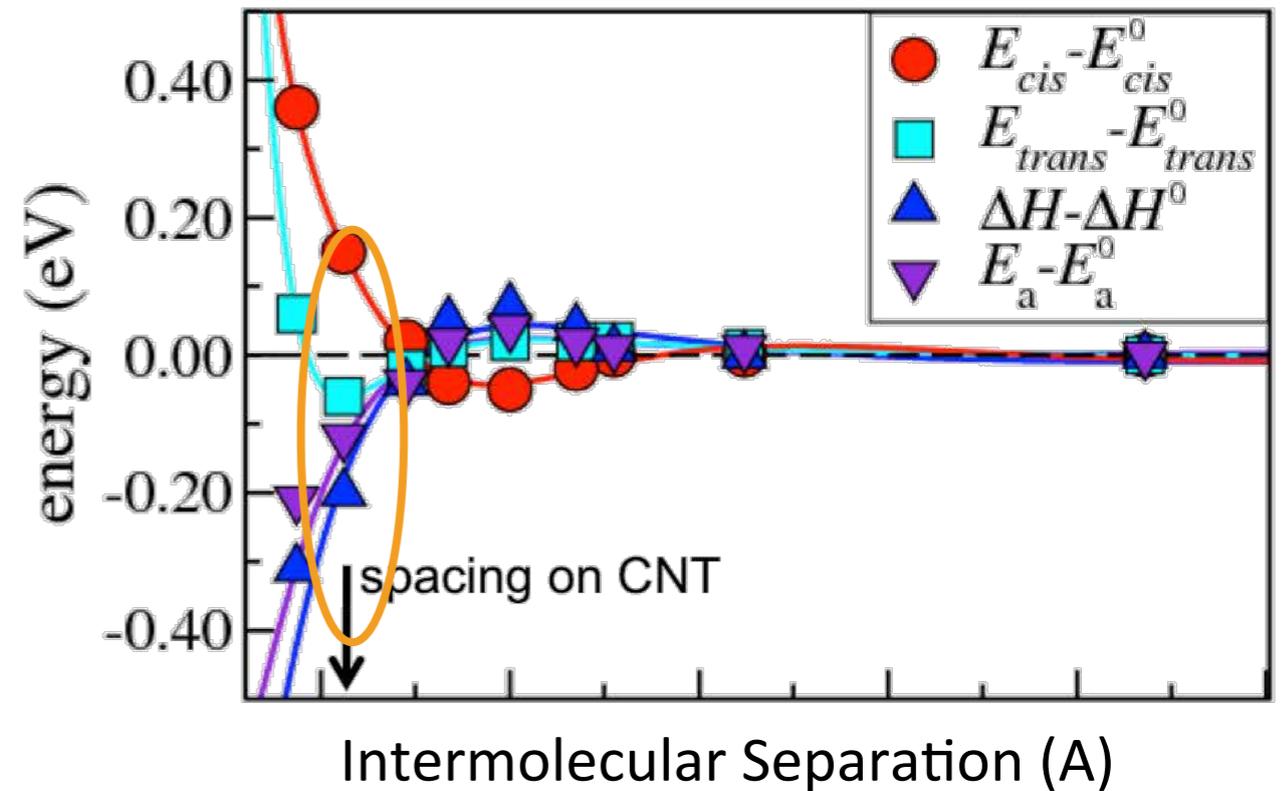

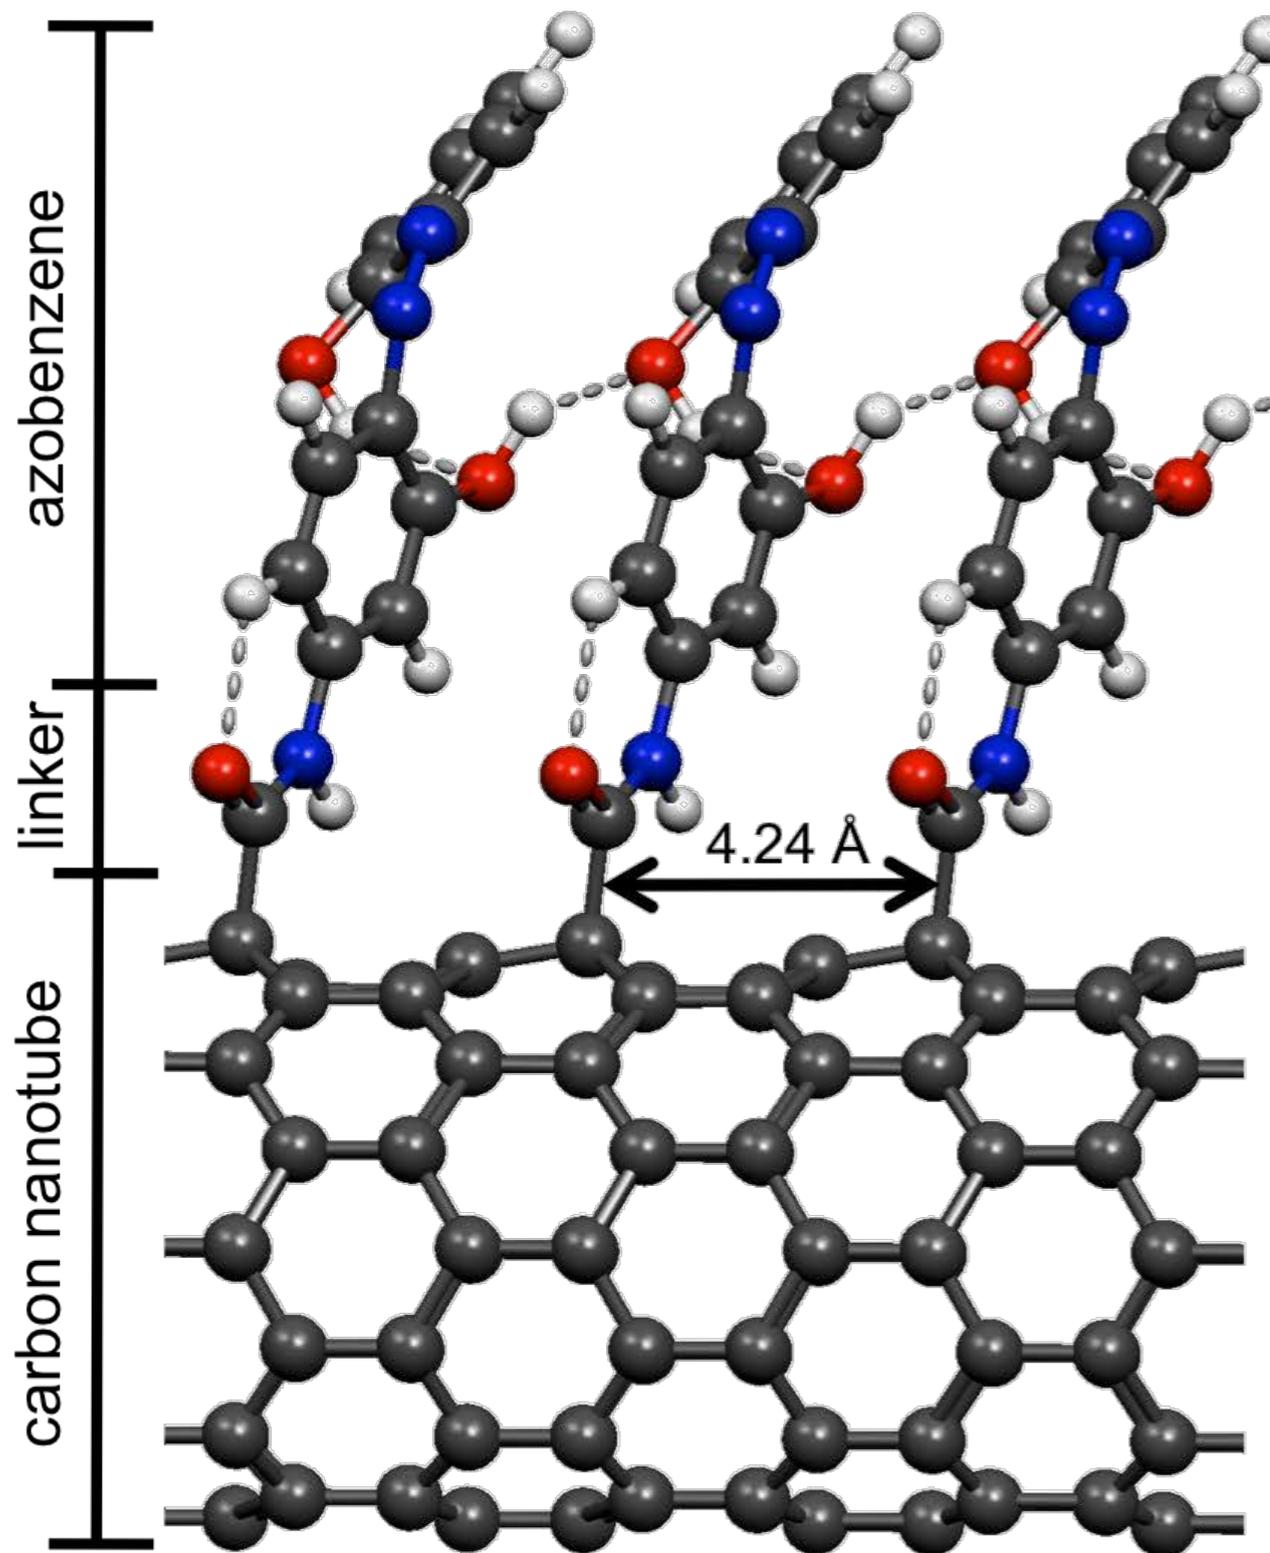

There are many, many photoactive molecules...

...that are terrible solar thermal fuels.

Can we turn them into good ones?

Role of the CNT template

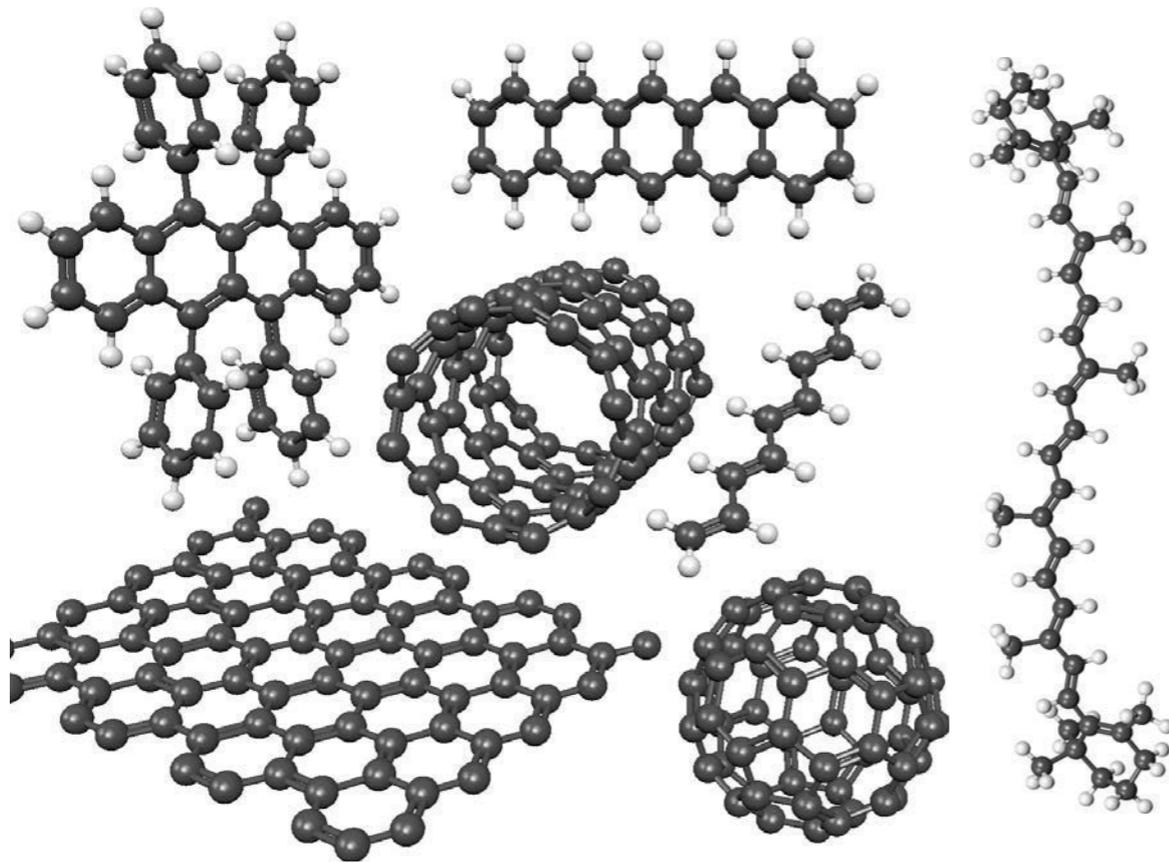

Rigid substrate – fixes inter-molecular distances over long range, enabling:

- steric inhibition
- π -stacking
- hydrophobic interactions

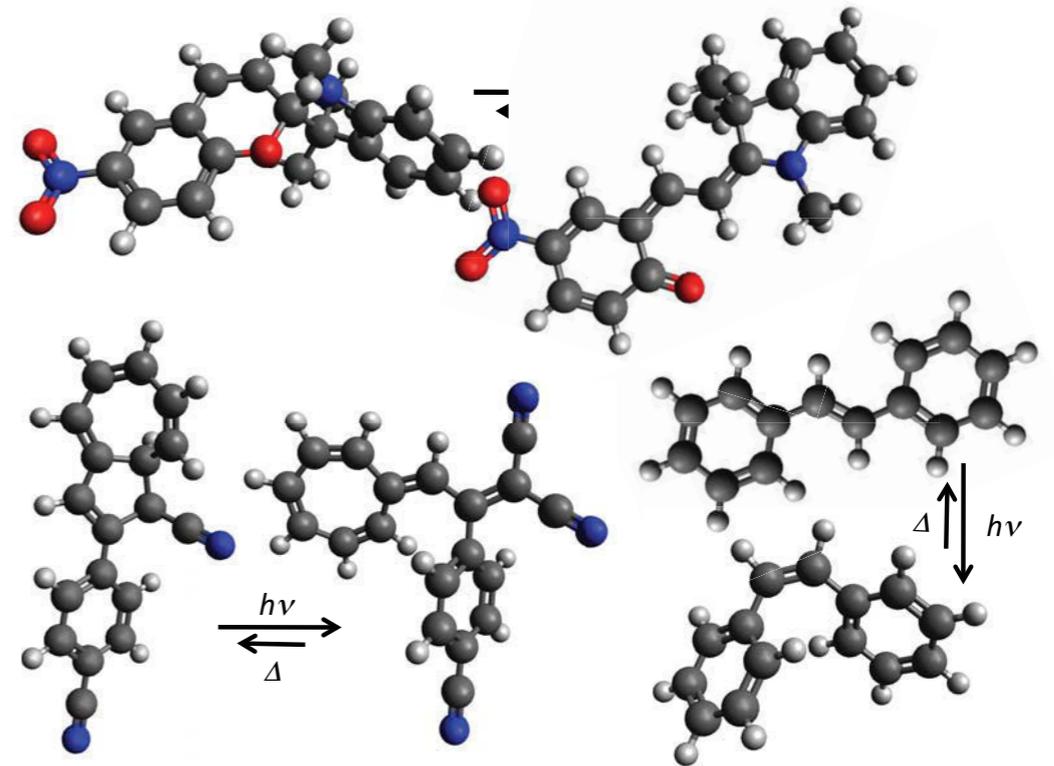

Enables design of **specific intermolecular interactions** – not available in free azobenzene

New Materials for Solar Thermal Fuels

In-Class Calculations of Solar Thermal Fuels

**Key Concept: Density of
States (DOS)**

From The Band Gap to Storage Efficiency

- Assume that all photons that have higher energy than the band gap get absorbed by the molecule AND lead to photo-isomerization.
- Let the fraction of molecules in the excited state (cis state) be x .
- Then, for a solar spectrum $I(\lambda)$:

$$x \int_0^{\lambda_{max,cis}} I(\lambda) d\lambda = (1 - x) \int_0^{\lambda_{max,trans}} I(\lambda) d\lambda$$

$$\lambda_{max} = \frac{hc}{E_{bandgap}}$$

From Absorption Spectra to Storage Efficiency

- Assume that all absorbed photons lead to photoisomerization.
- Let the fraction of molecules in the excited state (cis state) be x .
- Then, for a solar spectrum $I(\lambda)$:

$$x \int abs_{cis}(\lambda) \frac{I(\lambda)}{\left(\frac{hc}{\lambda}\right)} d\lambda = (1 - x) \int abs_{trans}(\lambda) \frac{I(\lambda)}{\left(\frac{hc}{\lambda}\right)} d\lambda$$

But how do we get this “abs” function?

--> from the energy levels!!

Summary/Reading

- What is convergence in a Quantum Mechanical Calculation?
- Feeling for what those energy levels mean!
- Connection of energy levels to light absorption, and connection of that to charging efficiency in solar fuels.
- Extra reading: google “atomic orbitals,” “molecular orbital theory,” etc.
- A bit on hydrogen storage.
