*“Viscosity makes things happen essentially in slow motion. If you are trying to melt a crystalline solid (like ice or an aluminum oxide ceramic), as soon as you reach the melting point, a drop of liquid forms and falls away from the melting surface. Glass, on the other hand, ... gradually transforms from a hard solid to a slowly softening liquid. This soft liquid gradually stiffens as it cools (because of its increasing viscosity), allowing glass blower time to shape and manipulate the glass.”*

# Viscosity reference points

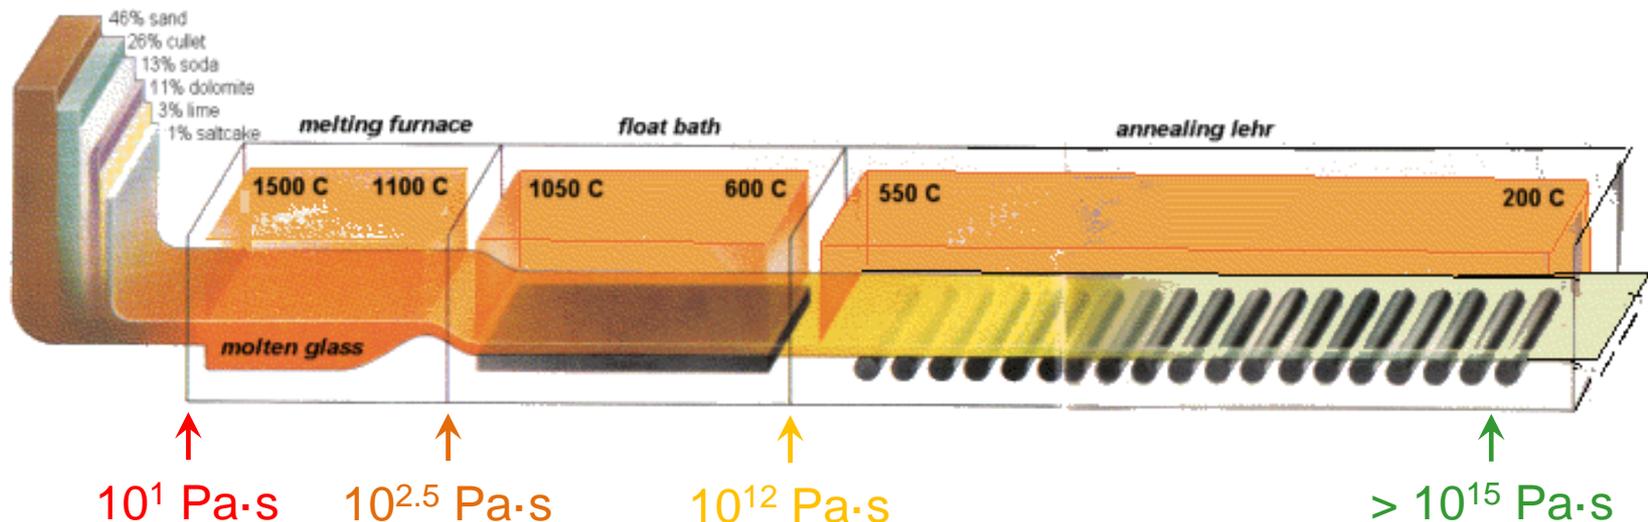

# Basic properties of common silicate glasses

	Soda-lime	Borosilicate	Fused silica
CTE (ppm/°C)	9.2	3.2	0.5
Working point (°C)	1005	1252	N/A
Softening point (°C)	696	821	1650
Annealing point (°C)	510	560	1140
Strain point (°C)	475	510	1070

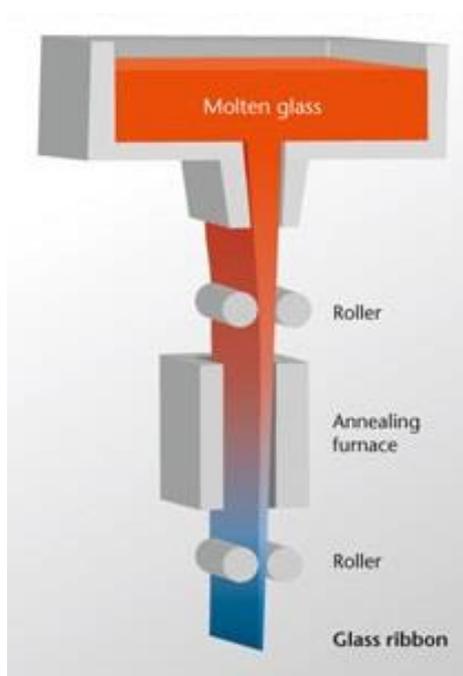

# Flat glass manufacturing: float glass process

- Forming of a continuous ribbon of glass using a molten tin bath
  - Melting and refining (homogenization and bubble removal)
  - Float bath: glass thickness controlled by flow speed
  - Annealing: stress release
  - Inspection, cutting and shipping

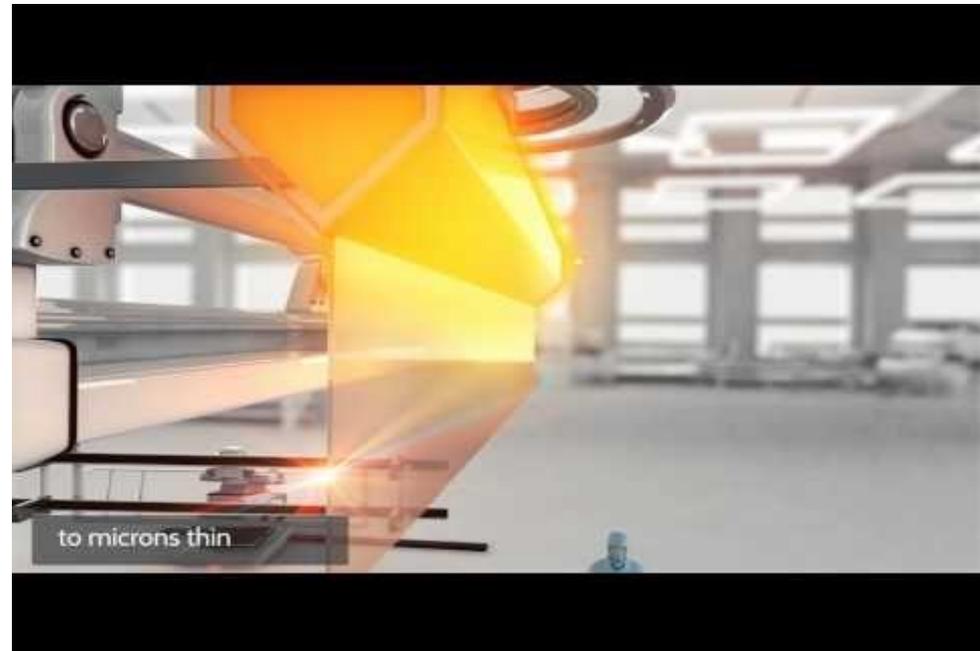

# Flat glass manufacturing: down-draw methods

- Preserves pristine surfaces: no subsequent polishing required
- Broad range of thicknesses from millimeter to tens of microns
- Mostly used for flat panel display glasses

# Glass container production

- Narrow-neck containers (e.g., bottles): blow-and-blow process

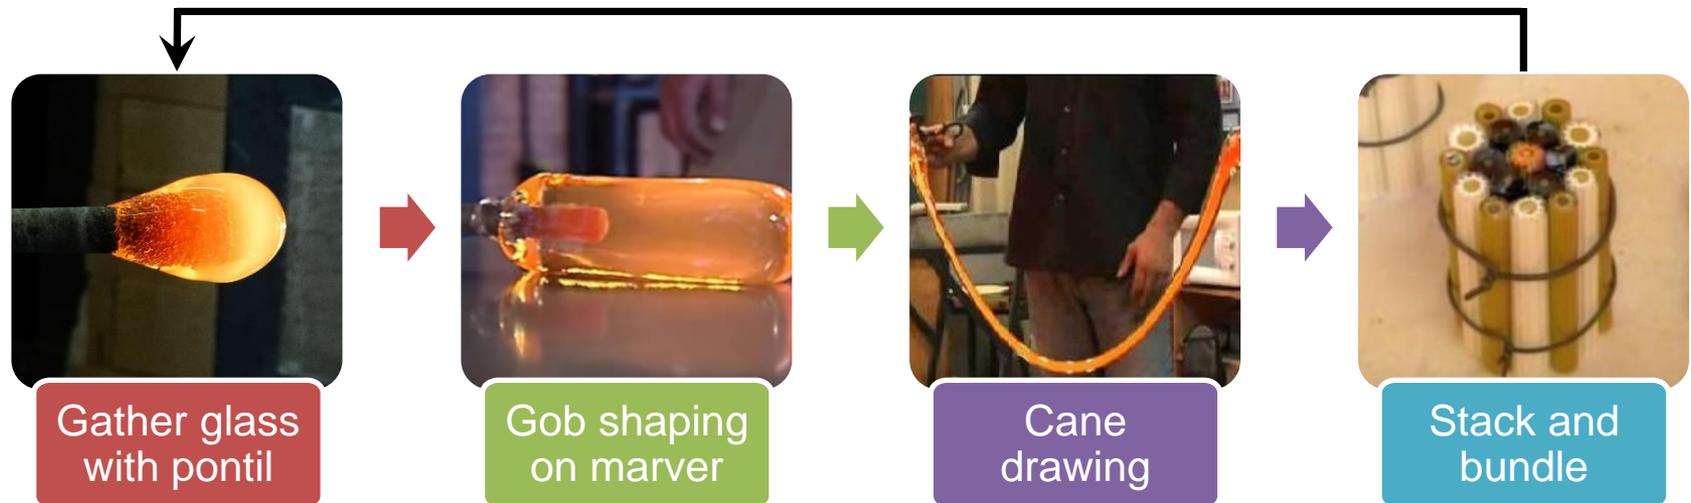

- Wide-mouthed jars: press-and-blow process

# Glass caneworking

- Canes: thin glass rods (often with color); can be of a single color, or contain multiple strands arrayed in a pattern (murrine)
- Basic glass work technique for adding intricate stripe patterns to glassware or blown glass

# Stability of drawn cane structures

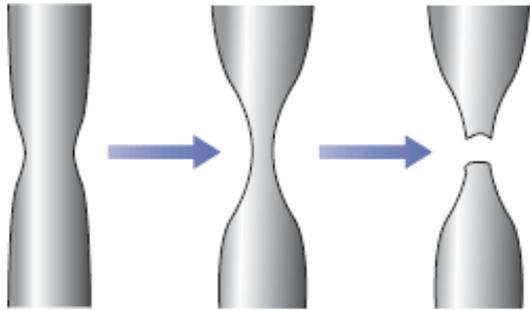

## Scaling analysis

- Scale-invariance of viscous flow: strain rate  $\dot{\epsilon}$  remains invariant if the externally applied stresses are kept constant regardless of system size

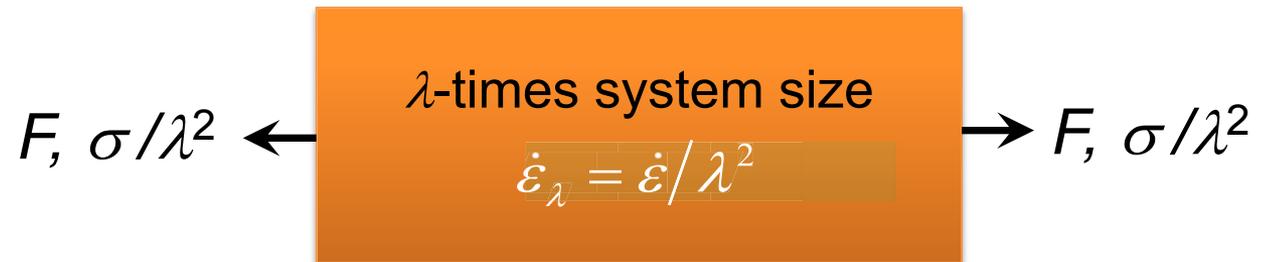

# Stability of drawn cane structures

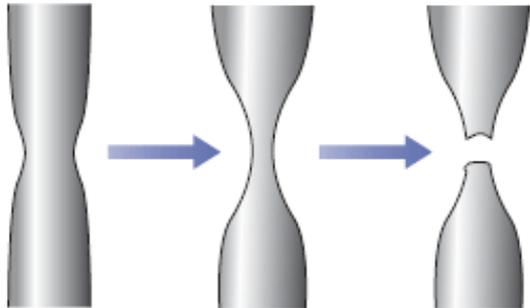

Cane diameter  $D$  change:

$$\frac{\partial D}{\partial t} \propto \frac{1}{\eta D}$$

Necking develops if  
viscosity is independent  
of diameter  $D$

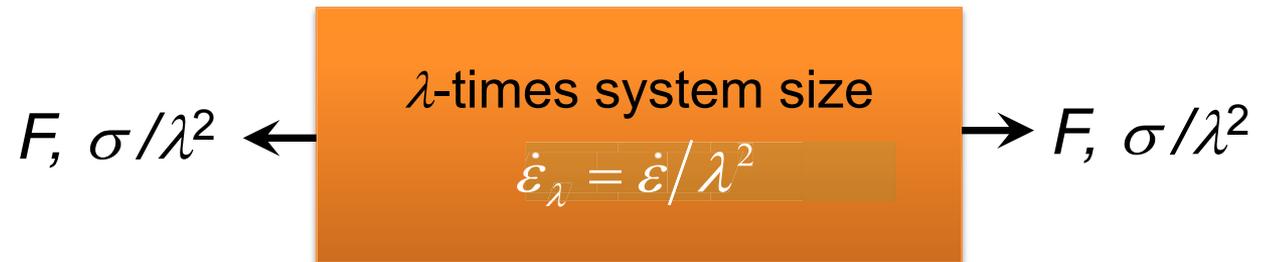

# Stability of drawn cane structures

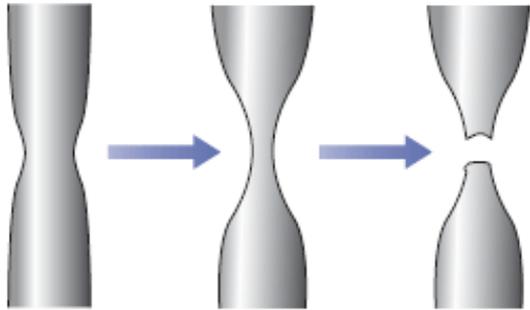

Stability threshold:

$$\dot{\epsilon} = \frac{1}{D} \frac{\partial D}{\partial t} \propto \frac{1}{\eta D^2} = \text{constant}$$

# Stability of drawn cane structures

Now consider heat dissipation:

- Radiative heat transfer dominates
- Stefan-Boltzmann law

Heat flux:  $q = e\sigma T^4$   $e$  : emissivity

$$\sigma = 5.67 \times 10^{-8} \text{ W/m}^2\text{K}^4$$

- Temperature change rate

$$\frac{\partial T}{\partial t} = -\frac{qS}{c_p V} = -\frac{4e\sigma T^4}{c_p D}$$

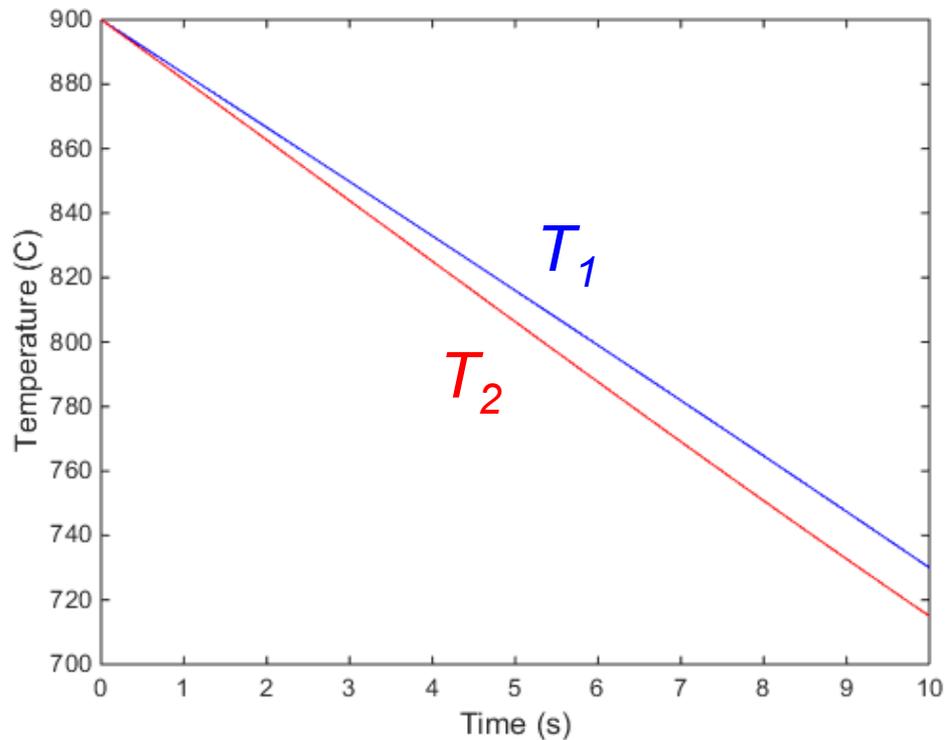

- Viscosity dependence on temperature

$$\eta = \eta_0 \exp\left[\frac{\Delta E_a(T)}{k_B T}\right] \quad \text{High } T \text{ range}$$

# Modeling outcome

Assumptions:

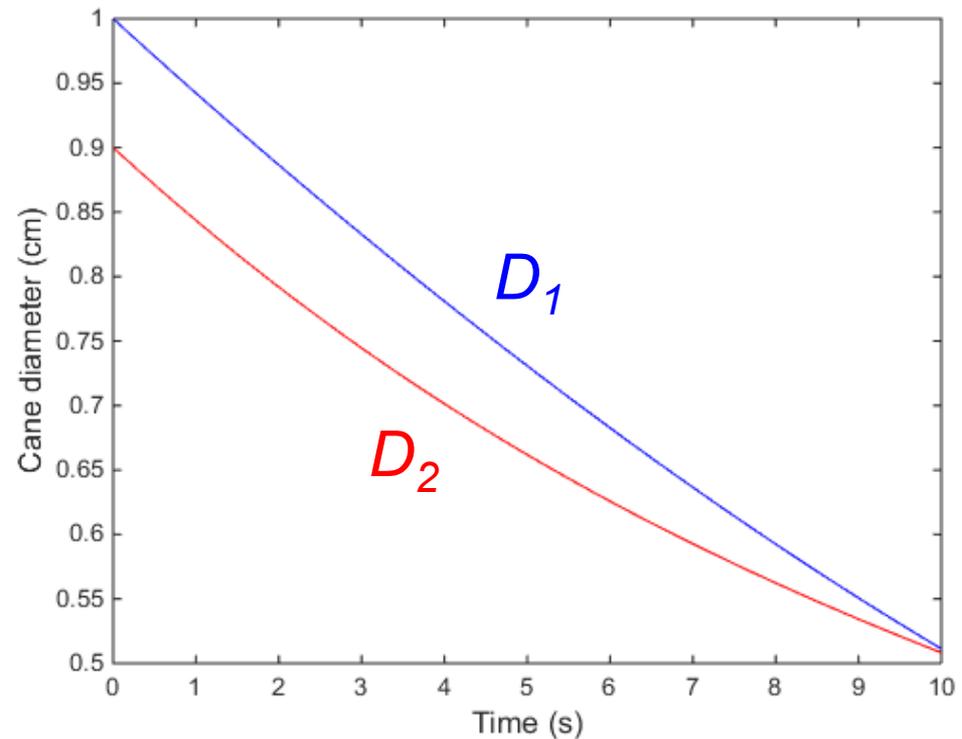

- Uniform temperature distribution along the cane cross-section
- No heat or mass exchange between cane sections
- Only considers radiative heat transfer from glass cane to the surroundings
- Constant drawing speed

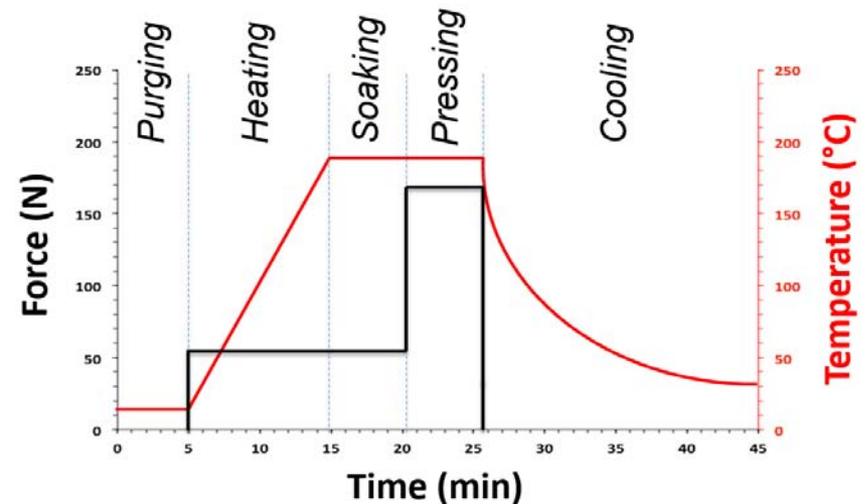

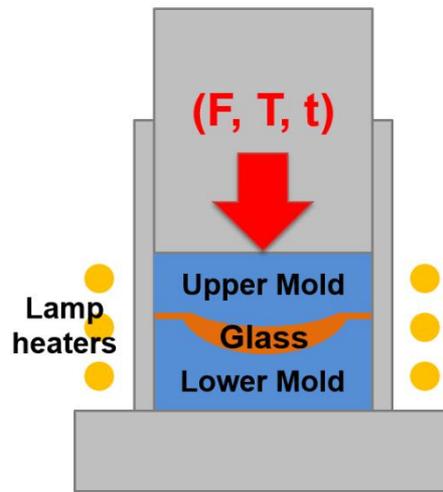

# Modeling outcome

Conclusions:

- Thinner section cools faster
- Viscosity increase in thinner section prevents necking
- Cane diameter non-uniformity damps out

# Precision glass molding (compression molding)

- Viscosity:  $10^{6.6} - 10^8$  Pa·s; pressure: ~ MPa
- Mold sticking and damage: TiN or SiC low friction coatings
- Non-uniform temperature distribution
- Post-molding deformation: thermal shrinkage, viscoelasticity

# Mechanical properties of bulk metallic glass (BMG)

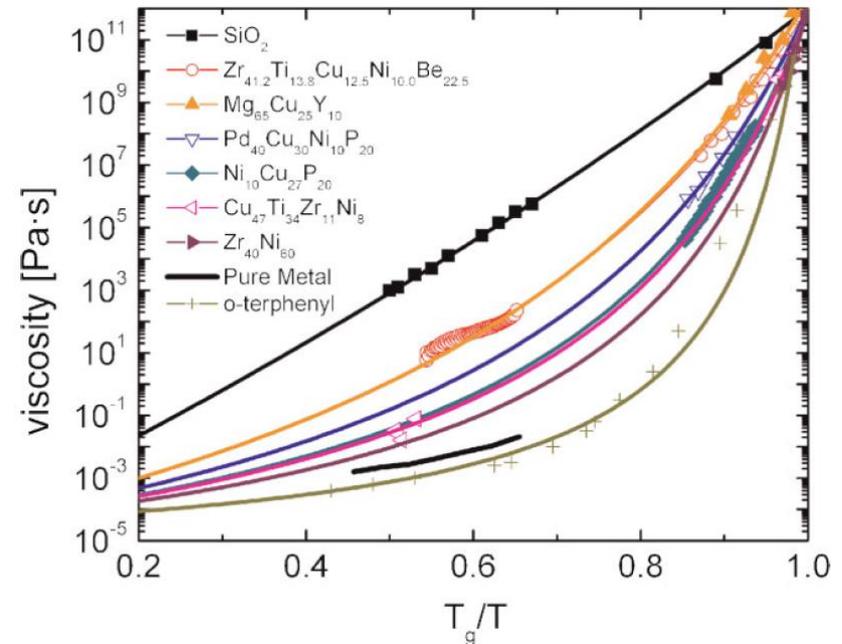

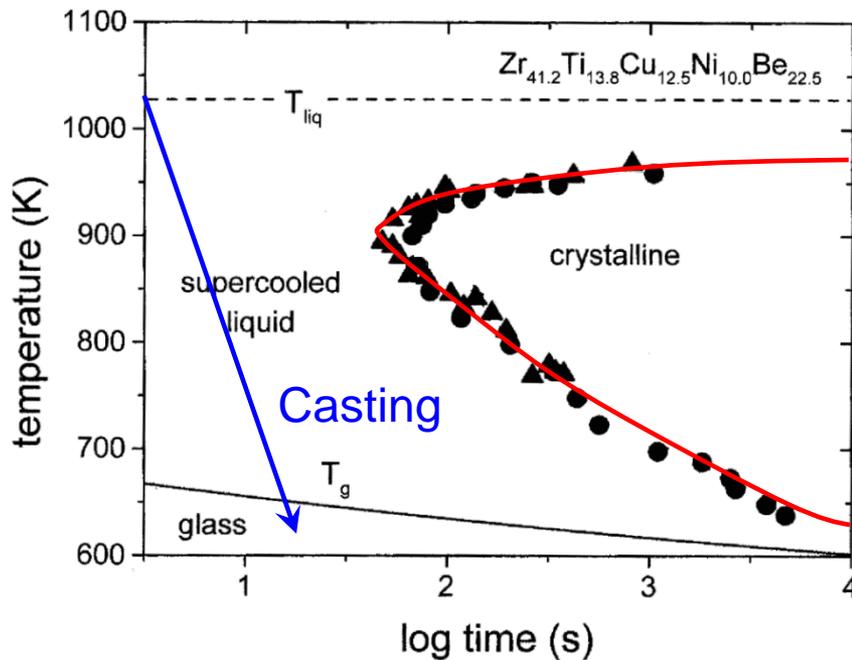

Amorphous metal

*Metals 3, 1 (2013).*

Figures courtesy of MDPI. License: CC BY.  
Source: Louzguine-Luzgin, D.V., et al. "Mechanical Properties and Deformation Behavior of Bulk Metallic Glasses." *Metals 3* (2013) 1-22.

- Absence of dislocations and slip planes in BMG
  - Large elastic limit and high yield strength (2% and 2 GPa in Zr-based BMGs)
  - Poor global plasticity: absence of strain hardening, strong tendency towards shear localization
- Cold working is not a viable processing solution

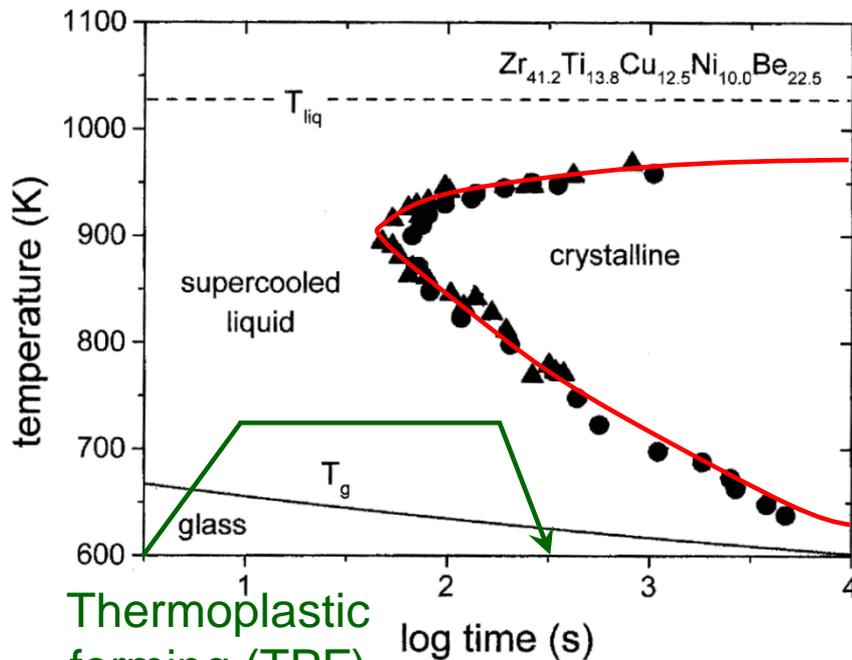

# BMG processing design

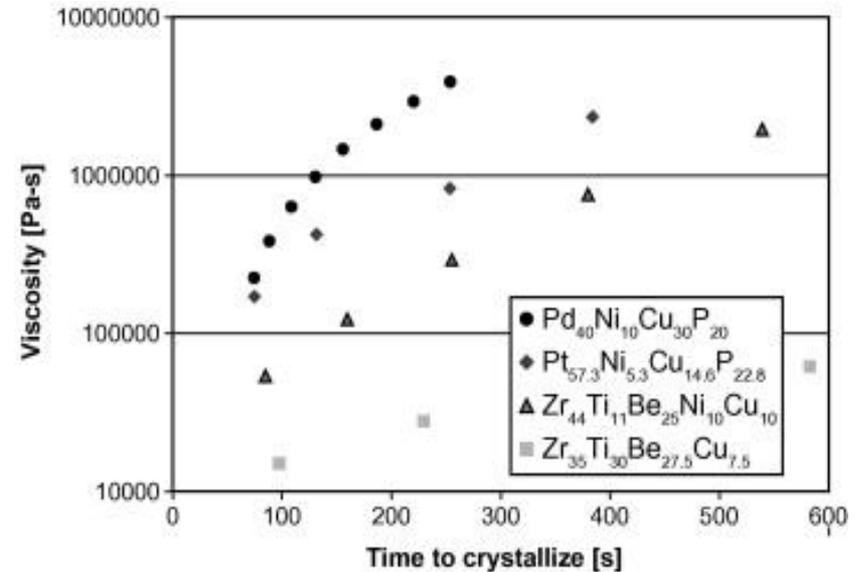

*Adv. Mater.* **22**, 1566 (2010).

- Casting: suction casting, die casting
  - Reduced volume shrinkage (< 1%)
  - Cooling rate control: mold filling and crystallization mitigation

# BMG processing design

Thermoplastic forming (TPF)

*Scripta Mater.* **60**, 160 (2009).

- Thermoplastic forming: compression & injection molding, extrusion, rolling, blow molding, 3-D printing
- Thermal embrittlement: free volume decrease
