# Solution for 18.112 Mid 1

## Problem 1.

*Solution:*

$$\begin{aligned} z^3 = 8e^{-i\pi/2} &\implies z = 2e^{-i(\frac{\pi}{6} + \frac{2n\pi}{3})}, \quad 0 \leq n \leq 2, \\ &\implies z = 2i \text{ or } z = \sqrt{3} - i \text{ or } z = -\sqrt{3} - i. \end{aligned}$$

## Problem 2.

*Method 1.*

$$\begin{aligned} \int_{|z-1|=\frac{1}{2}} \frac{dz}{(1-z)^3} &= \int_0^{2\pi} \frac{ie^{it}/2}{(-e^{it}/2)^3} dt \\ &= \frac{-i}{2} \cdot 8 \int_0^{2\pi} e^{-i \cdot 2t} dt \\ &= -4i \left. \frac{e^{-2it}}{-2i} \right|_0^{2\pi} \\ &= 0. \end{aligned}$$

*Method 2.* Let  $f(z) \equiv 1$ . By (24) on Page 120, we get

$$0 = f''(1) = \frac{2!}{2\pi i} \int_{|z-1|=\frac{1}{2}} \frac{dz}{(z-1)^3}.$$

## Problem 3.

*Solution:* 1)  $\int_{|z|=1} \frac{e^z+z}{z-2} dz = 0$ , since  $2 \notin \{z : |z| < 1\}$ .

2)  $\int_{|z|=3} \frac{e^z+z}{z-2} dz = 2\pi i(e^2 + 2)$ , since  $n(\gamma, 2) = 1$ . (Theorem 6 on P119.)

**Problem 4.**

*Solution:* Let

$$g(z) = f\left(\frac{1}{z}\right), \quad \forall z \neq 0,$$

then  $g$  is analytic on  $\mathbb{C} \setminus \{0\}$ , and the singularity at 0 is removable or is pole of order  $h$ .

If the singularity of  $g$  at 0 is removable, then  $\lim_{z \rightarrow 0} g(z)$  exists and is finite, i.e.  $\lim_{z \rightarrow \infty} f(z)$  exists and is finite. Thus  $f$  is bounded on  $\mathbb{C}$ . Since  $f$  is analytic and bounded in the whole plane, it is a constant.

If 0 is pole of order  $h$ , then

$$g(z) = B_h z^{-h} + B_{h-1} z^{-h+1} + \dots + B_1 z^{-1} + \phi(z),$$

where  $\phi(z)$  is analytic on  $\mathbb{C}$ . Since  $f$  is continuous (analytic) at 0,  $\lim_{z \rightarrow \infty} g(z)$  exists and is finite. Thus  $\lim_{z \rightarrow \infty} \phi(z)$  exists and is finite. So  $\phi(z)$  is bounded in the whole plane, and thus  $\phi(z) = B_0$  is constant. So

$$f(z) = g\left(\frac{1}{z}\right) = B_h z^h + B_{h-1} z^{h-1} + \dots + B_1 z + B_0$$

is polynomial.

**Problem 5.**

*Method 1.* Take

$$C : |z| = R, \text{ where } R > 100.$$

For any  $m > n$ , we have

$$\begin{aligned} |f^{(m)}(0)| &= \left| \frac{m!}{2\pi i} \int_C \frac{f(\xi) d\xi}{\xi^{m+1}} \right| \\ &\leq \frac{m!}{2\pi} \left| \int_C \xi^{n-m-1} d\xi \right| \\ &= \frac{m!}{2\pi} \frac{R^{n-m}}{n-m} \longrightarrow 0 \text{ as } R \rightarrow \infty. \end{aligned}$$

Thus  $f^{(m)}(0) = 0$  for any  $m > n$ . By the Taylor expansion,

$$\begin{aligned} f(z) &= f(0) + \frac{f'(0)}{1!} z + \dots + \frac{f^n(0)}{n!} z^n + \frac{f^{n+1}(0)}{(n+1)!} z^{n+1} + \dots \\ &= f(0) + \frac{f'(0)}{1!} z + \dots + \frac{f^n(0)}{n!} z^n \end{aligned}$$

is polynomial.

*Method 2.* By  $|f(z)| < |z|^n$ , we know

$$\lim_{z \rightarrow 0} z^{n+1} f(1/z) = 0,$$

i.e.  $f$  has a nonessential singularity at  $\infty$ . By last problem,  $f$  is polynomial.
