# Lecture 1: The algebra of Complex numbers

(Text 1-11 & 19-20)

## Remarks on Lecture 1

► On p.19-20, it is stated that each circle in  $\mathbb{C}$

$$(x - a)^2 + (y - b)^2 = r^2 \tag{1}$$

has the form

$$(\alpha_0 - \alpha_3)(x^2 + y^2) - 2\alpha_1x - 2\alpha_2y + \alpha_0 + \alpha_3 = 0,$$

so the mapping  $z \mapsto Z$  maps circles in the plane to circles on  $S$ . Solving the equations

$$a = \frac{\alpha_1}{\alpha_0 - \alpha_3}, \quad b = \frac{\alpha_2}{\alpha_0 - \alpha_3}, \quad r^2 - a^2 - b^2 = -\frac{\alpha_0 + \alpha_3}{\alpha_0 - \alpha_3}$$

for  $\alpha_0, \alpha_1, \alpha_2, \alpha_3$  is disagreeable so we instead determine the image of the curve (1) under the map  $z \mapsto Z$ . Using the formulas (24)-(26) and

$$1 - x_3 = \frac{2}{1 + |z|^2},$$

formula (1) becomes

$$ax_1 + bx_2 + \frac{1 + r^2 - a^2 - b^2}{2}x_3 = \frac{a^2 + b^2 - r^2 + 1}{2}.$$

This is a plane which must intersect the sphere so has distance  $< 1$  from 0.

► The formula (28) can be proved geometrically as follows (Exercise 4):

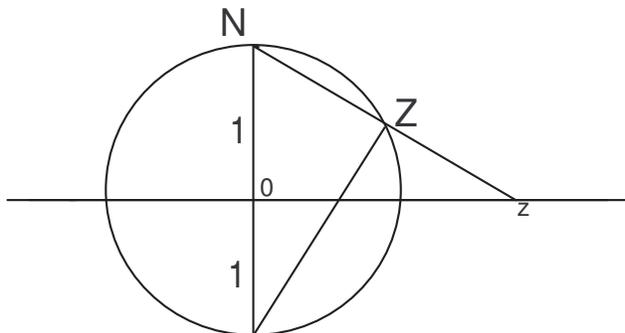

Fig. 1-1

Let  $Z \in S$  lie on the plane

$$x_2 = 0.$$

The angles at  $Z$  are right angles, so by similar triangles:

$$\begin{aligned} \frac{d(N, Z)}{2} &= \frac{1}{d(N, z)} \\ &= \frac{1}{\sqrt{1 + |z|^2}}. \end{aligned}$$

Thus

$$\frac{d(N, Z)}{d(N, z')} = \frac{2}{\sqrt{1 + |z|^2} \sqrt{1 + |z'|^2}}$$

and by symmetry this is

$$\frac{d(N, Z')}{d(N, z)}.$$

Thus the triangles  $\triangle NZZ'$  and  $\triangle Nz z'$  are similar, so the above ratio is

$$\frac{d(Z, Z')}{|z - z'|}.$$

This proves (28).

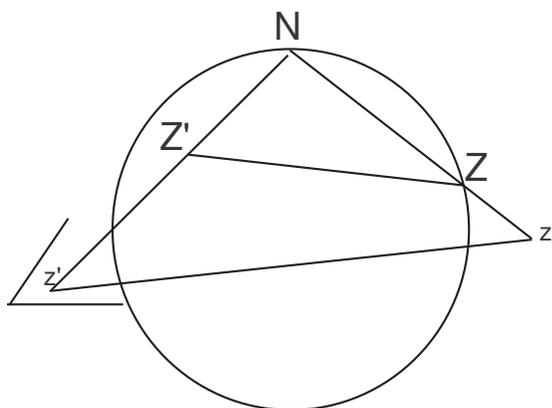

Fig. 1-2

► Finally we show that the spherical representation  $z \mapsto Z$  is conformal. This means that if  $l$  and  $m$  are two lines in the plane intersecting in  $z$  at an angle  $\alpha$ , then the corresponding circles  $C$  and  $D$  through  $N$  and  $Z$  intersect  $Z$  at the same angle  $\alpha$ . Consider the tangent plane  $\pi$  to  $S$  at the point  $N$ . the plane through  $Z$  and  $l$  intersects  $\pi$  in a line  $l'$ . Similarly the plane through  $Z$  and  $m$  intersect  $\pi$  in  $m'$ . Clearly  $l'$  and  $m'$  intersect at  $N$  at the same angle  $\alpha$ . Since they are tangents to  $C$  and  $D$  at  $N$ ,  $C$  and  $D$  must intersect at the angle  $\alpha$  both at  $N$  and at  $Z$ .
