

### The Spectral Theorem for Hermitian Matrices

This is the proof that I messed up at the end of class on Nov 15.

For reference:  $A$  Hermitian means  $A^* = A$ .  $P$  unitary means  $P^*P = I$ .

**Theorem.** *Let  $A$  be a Hermitian matrix. There is a unitary matrix  $P$  such that  $A' = P^*AP$  is a diagonal matrix.*

Some notation: We think of multiplication by the Hermitian matrix  $A$  as a linear operator on the standard Hermitian space  $V = \mathbb{C}^n$ , and we call that operator  $T$ . So  $A$  is the matrix of  $T$  with respect to the standard basis  $\mathbf{E}$ . The form on  $V$  is the standard Hermitian form  $\langle v, w \rangle = v^*w$ .

Let  $\mathbf{B} = (v_1, \dots, v_n)$  be a new basis, defined by  $\mathbf{B} = \mathbf{E}P$ , where  $P$  is unitary. The columns of  $P$  are the coordinate vectors of the vectors  $v_i$ . Since  $P$  is unitary,  $P^* = P^{-1}$  and  $P^*AP = P^{-1}AP$ . So  $A' = P^*AP$  is the matrix of the operator  $T$  with respect to  $\mathbf{B}$ . Therefore  $A$  and  $A'$  have the same eigenvalues.

We note that  $A'$  is Hermitian:  $A'^* = (P^*AP)^* = P^*A^*P^{**} = P^*AP = A'$ .

*proof of the theorem.* We choose an eigenvector  $v_1$  of  $A$  and normalize its length to 1. Let  $W$  be the one-dimensional subspace  $\text{Span}(v_1)$  of  $V$ . The matrix of the Hermitian form, restricted to  $W$ , is the  $1 \times 1$  matrix whose unique entry is  $\langle v_1, v_1 \rangle = 1$ . This matrix is invertible, so  $V = W \oplus W^\perp$ .

We choose an orthonormal basis  $(v_2, \dots, v_n)$  of  $W^\perp$ . Then  $\mathbf{B} = (v_1, v_2, \dots, v_n)$  will be an orthonormal basis of  $V$ . Since  $v_1$  is an eigenvector, the matrix of  $T$  with respect to  $\mathbf{B}$  will have the block form

$$A' = \begin{pmatrix} \lambda_1 & B \\ 0 & D \end{pmatrix},$$

where  $D$  is an  $(n-1) \times (n-1)$  matrix,  $B$  and  $0$  are row and column vectors, respectively, and  $\lambda_1$  is the eigenvalue of  $v_1$ . Since  $A'$  is Hermitian,  $B = 0$  and  $D$  is Hermitian. It is the matrix that represents the operator  $T$  on  $W^\perp$ . By induction on dimension, we can choose the orthonormal basis  $(v_2, \dots, v_n)$  of  $W^\perp$  so that  $D$  becomes diagonal. Then  $A'$  is also diagonal.  $\square$

**Corollary.** *The eigenvalues of a Hermitian matrix are real.*

*proof.* With notation as above, the eigenvalues of the matrix  $A$  are the same as those of  $A'$ . Since  $A'$  is Hermitian, its diagonal entries are real, and since  $A'$  is diagonal, its diagonal entries are the eigenvalues.  $\square$

**Corollary.** *The eigenvalues of a real symmetric matrix are real.*

*proof.* A real symmetric matrix is Hermitian.  $\square$
