

2.008

Manufacturing Systems

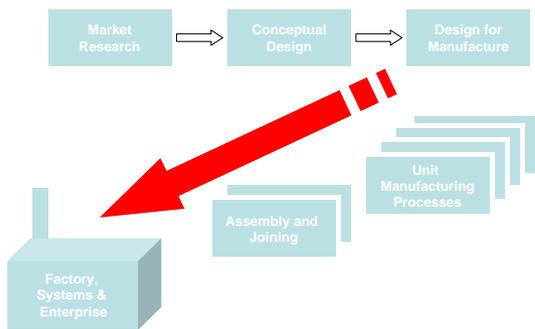

Outline

1. Manufacturing Systems
2. Types of Plant Layouts
3. Production Rates
4. Design and Operations

2.008 - Spring 2004

2

Manufacture

What is mfg systems?

2.008 - Spring 2004

4

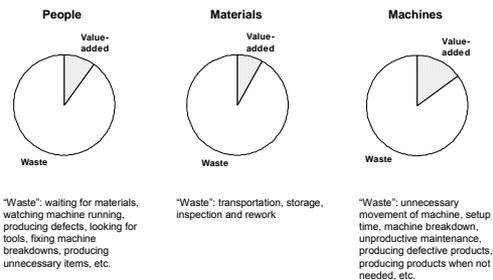

Time spectrum of Typical Activities in a Manufacturing Organization

Seconds	Period	Activity
10 ⁸	Decade Year Month	Plant design, Machine Selection, System Simulation Process design: CAD Catalogs Select manufacturing methods
10 ⁷		
10 ⁶		
10 ⁵	Week Day	Factory Operation Ship - Receive Transport Inventory
10 ⁴		
10 ³		
10 ²	Minute	Part handling Load/Unload Assembly
10 ¹		
1		
.1	Second	Machine control CNC - DNC Adaptive control Intelligent machines Process control
.01		
.001		
	Millisecond	

2.008 - Spring 2004

5

How Man, Machine, and Material Spend Time in the Factory

2.008 - Spring 2004

6

Disruptions/Variation (Random Events)

- Machine failure
- Set-up change
- Operator absence
- Starvation/Blockage
- Demand change

2.008 - Spring 2004

7

Types of Plant Layout

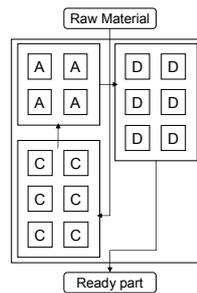

- Job Shop
- Project Shop
- Flow Line
- Transfer Line
- Cellular System

2.008 - Spring 2004

8

Job Shop

Machines/Resources are grouped according to the process they perform

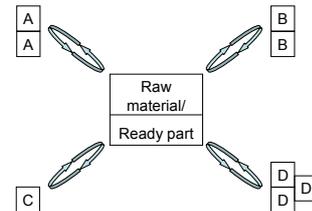

2.008 - Spring 2004

9

Project Shop

Machines/Resources are brought to and removed from stationary part as required

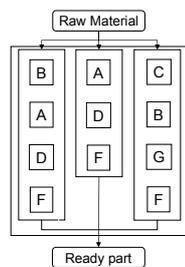

2.008 - Spring 2004

10

Flow Line and Transfer Line

Machines/Resources are grouped in lines according to the processes sequence of part(s)

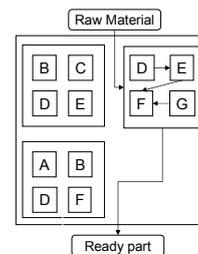

2.008 - Spring 2004

11

Cellular System

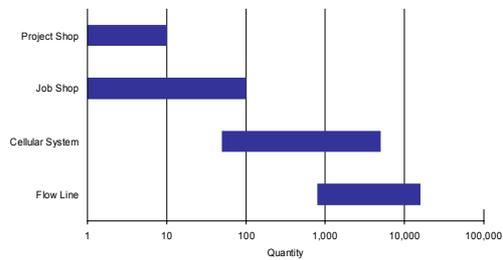

Machines/Resources are grouped according to the processes required for part families

2.008 - Spring 2004

12

Production Quantity and Plant Layout

2.008 - Spring 2004

13

Production Rates

- Case I:
 - One machine
 - Everything works

$$\text{Production rate} = \frac{1}{\text{Operation time}}$$

2.008 - Spring 2004

14

Production Rates (cont'd)

- Case II:
 - One machine
 - Machine breaks down (disruption)
 - Everything else works

$$\text{Efficiency (utilization)} = \frac{\text{MTTF}}{\text{MTTF} + \text{MTTR}} = \frac{\text{MTTF}}{\text{MTTR}}$$

$$\text{Production rate} = \frac{\text{Efficiency}}{\text{Operation time}}$$

2.008 - Spring 2004

15

Production Rates (cont'd)

- Case III:
 - Many machines
 - No machine breaks down
 - No buffers

2.008 - Spring 2004

16

Production Rates (cont'd)

- Case IV:
 - Many machines (same operation time)
 - No machine breaks down
 - No buffers

2.008 - Spring 2004

17

Production Rates (cont'd)

- Case V:
 - Many machines (same operation time)
 - Machine breaks down
 - No buffers

2.008 - Spring 2004

18

Production Rates (cont'd)

- Case VI:
 - Many machines and buffers in between
 - Machine breaks down

2.008 - Spring 2004

19

Production Rates (cont'd)

- Production rate increases if:
 - Increase the rate of the slowest machine
 - Reduce the disruptions
 - Introduce “buffers”
 - Introduce in-process control

2.008 - Spring 2004

20

Disruptions (Random Events)

- Machine failure
- Set-up change
- Operator absence
- Starvation/Blockage

2.008 - Spring 2004

21

Waiting

- Underutilization
- Idleness
- Inventory

2.008 - Spring 2004

22

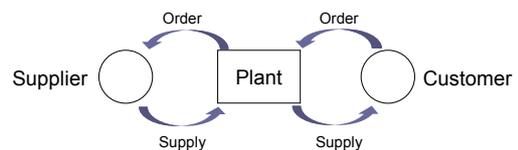

Inventory/Work-in-Process (WIP)

- It costs money
- It gets damaged
- It becomes obsolete
- It shrinks
- It increases lead time

2.008 - Spring 2004

23

Cycle Time and Lead Time

$$\text{Takt time} = \frac{\text{Daily available time}}{\text{Daily average demand}}$$

2.008 - Spring 2004

24

Cycle Time

“Cycle Time”

- The time a part spends in the system

Little's Law: $L = \lambda w$

L: average inventory

λ : average production rate

w: average cycle time

2.008 - Spring 2004

25

Cycle Time (cont'd)

- Example:

Operation time = 1, One-piece operation

Production rate = 1

Cycle time = 5

Inventory = 5

2.008 - Spring 2004

26

Cycle Time Batch Production

Operation time: 3 minutes

Batch (Lot) size: 1000

Cycle time = $1,000 \cdot 3 + 1,000 \cdot 3 + 1,000 \cdot 3 = 9,000 \text{min}$

2.008 - Spring 2004

27

Cycle Time One-Piece Production

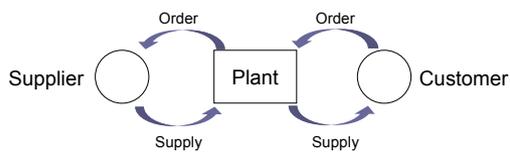

Operation time = 3 minutes

Cycle time = $1,000 \cdot 3 + 2 \cdot 3 = 3,006 \text{ minutes}$

2.008 - Spring 2004

28

Cycle Time and Lead Time

$$\text{Takt time} = \frac{\text{Daily available time}}{\text{Daily average demand}}$$

2.008 - Spring 2004

29

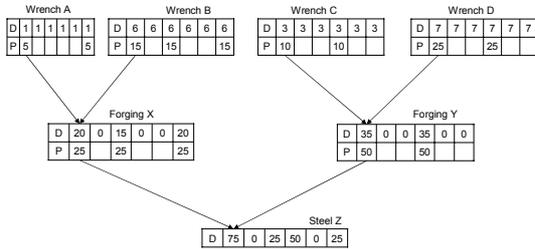

Systems Design and Operation

- Cycle time < Lead time
- Lumpiness
- Information contents

2.008 - Spring 2004

30

Lumpy Demand

2.008 - Spring 2004

31

Typical Design Guidelines

- Leveling
- Balancing
- Single-piece flow
- Low materials handling
- Low setup time
- Smaller lot size
- Low WIP
- Faster feedback

2.008 - Spring 2004

32

Plant Operations

- Push (MRP, ERP, etc.) vs. Pull (JIT)
- Batch vs. One-piece

2.008 - Spring 2004

33
