Lecture 2

22.033/22.33 – Nuclear Engineering Design Project
September 14, 2011

The Three Challenge Problems

Heat exchanger (Hx) design

Heat transport

Heat storage (if necessary)

First, Some Nomenclature

Sensible heating – temperature change

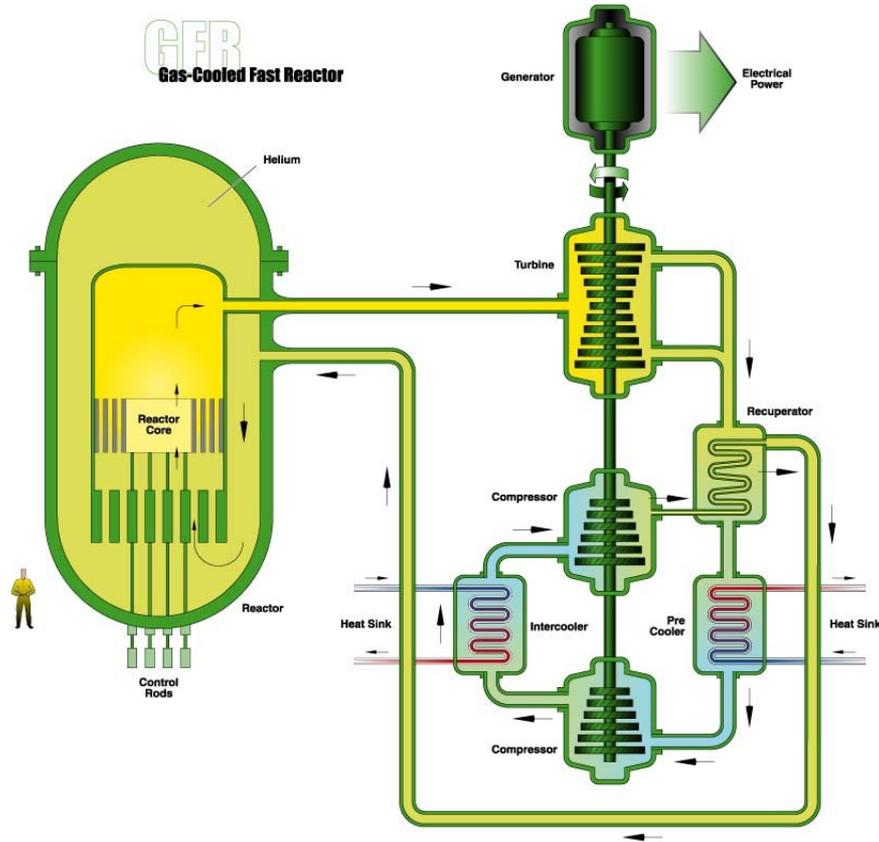

$$Q = \dot{m} c_p \Delta T$$

Latent heating – phase change

$$Q = \dot{m} h_{fg}$$

Bond energy storage – enthalpy of chemical reactions

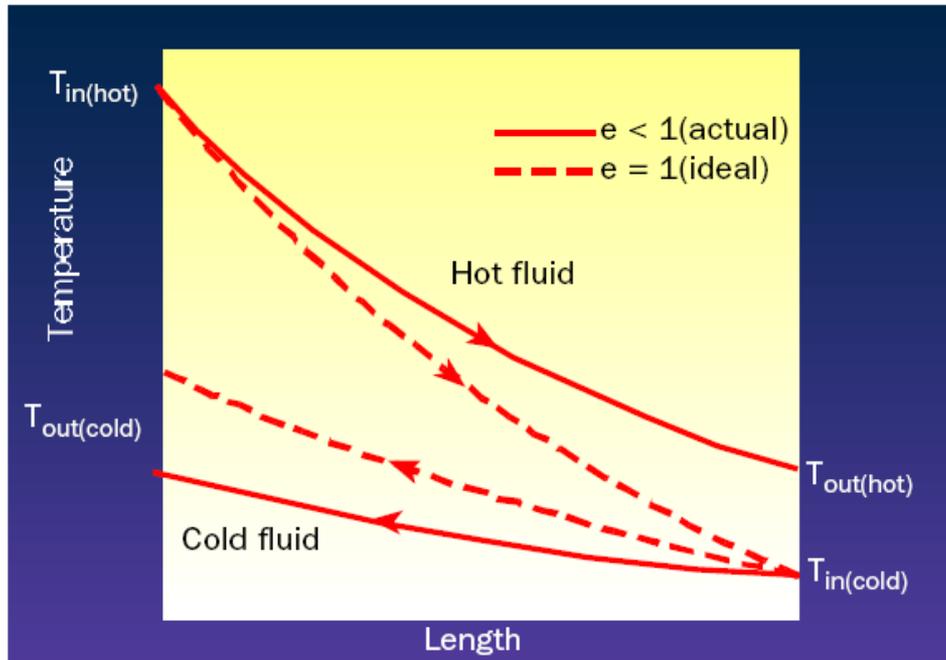

Where Do We Find Them?

Hx effectiveness (ϵ)

- Measures how much heat is transferred compared to how much is possible

$\epsilon=1$ is ideal, but

practically

impossible (big Hx)

Heat Exchangers – Fundamental Parameters

Diagram of heat exchanger removed due to copyright restrictions. See lecture video for details.

Heat Exchangers – Fundamental Parameters

$$Q = U \cdot A \cdot F \cdot \Delta T_{lm}$$

Q = Heat transfer rate (W)

U = Thermal conductance ($\text{W}/\text{m}^2\text{K}$)

A = Heat transfer area (m^2)

ΔT_{lm} = Log mean temperature difference (K)

F = Factor (for flow configuration)

Heat Exchangers – Log Mean Temperature Difference (LMTD)

$$\Delta T_{lm} = \frac{(\Delta T_H - \Delta T_C)}{\ln\left(\frac{\Delta T_H}{\Delta T_C}\right)}$$

LMTD is a good measure of the effectiveness of similar heat exchangers of different designs

Often, LMTD (counter flow) > LMTD (parallel flow)

Heat Exchangers – Finding Key Parameters

Figure 1 – A big, complicated heat exchanger chart

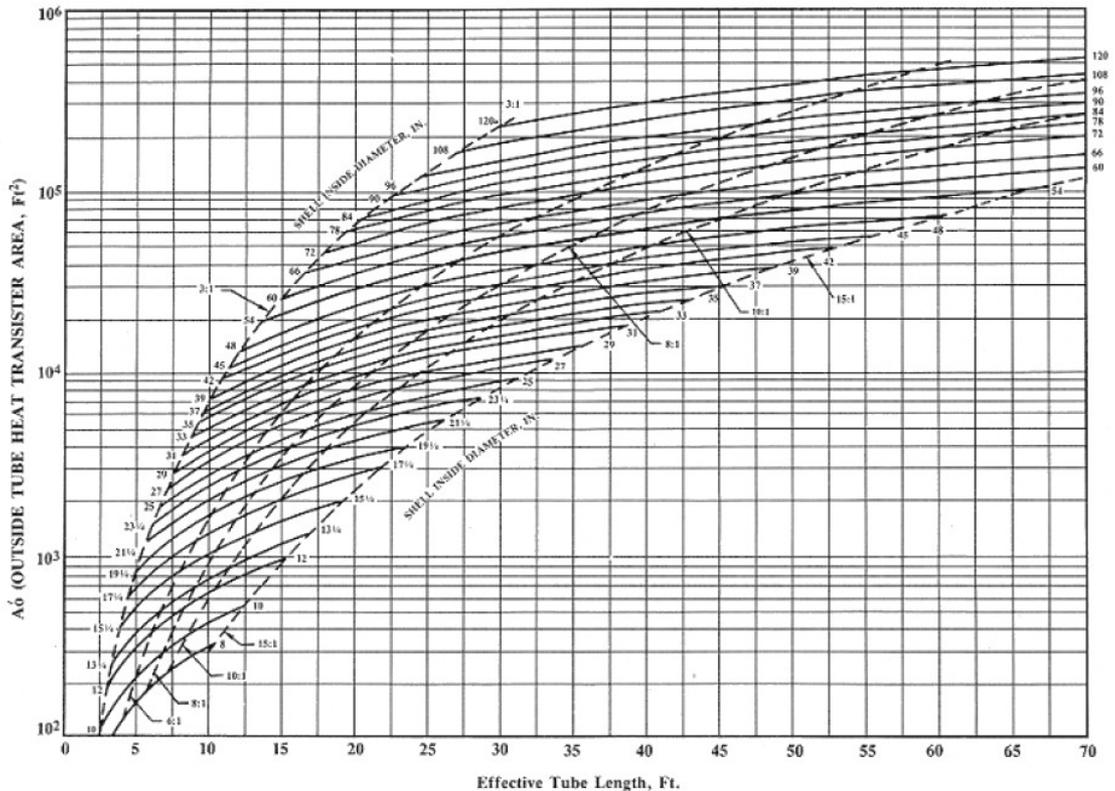

Fig. 2.26 Area as a Function of Shell Inside Diameter and Effective Tube Length for 3/4 in. O.D. S/T Tru-fin 19 Fins/In. on 15/16 in. Equilateral Triangular Tube Layout Fixed Tube Sheet, One Tubeside Pass, Fully Tubed Shell.

Heat Exchangers – Fundamental Parameters

$$\varepsilon = \frac{C_h(T_{h,i} - T_{h,o})}{C_{\min}(T_{h,i} - T_{c,i})} = \frac{C_c(T_{c,o} - T_{c,i})}{C_{\min}(T_{h,i} - T_{c,i})}$$

For all flow configurations

$$C^* = \frac{C_{\min}}{C_{\max}} = \frac{(\dot{m}c_p)_{\min}}{(\dot{m}c_p)_{\max}} = \begin{cases} (T_{c,o} - T_{c,i}) / (T_{h,i} - T_{h,o}) & \text{for } C_h = C_{\min} \\ (T_{h,i} - T_{h,o}) / (T_{c,o} - T_{c,i}) & \text{for } C_c = C_{\min} \end{cases}$$

Hx is “balanced” when $C^* = 1$

$$NTU = \frac{UA}{C_{\min}} = \frac{1}{C_{\min}} \int_A U dA$$

NTU = Number of Transfer Units

Heat Exchangers - Questions

What type to use?

What working fluids?

What geometry? Flow considerations? Laminar or turbulent?

Where is the tradeoff between cost & performance?

Materials concerns?

**See also: T. Kuppan. “Heat exchanger design handbook.”
and Som, “Introduction To Heat Transfer.**

Heat Transport

Main problem: Get process heat from the reactor to the hydrogen & biofuels plants

How? Must consider:

- Temperatures
- Losses
- Flow rates
- Flow transients

Heat Transport – Long Distance

How to model it?

- Thermal resistances
- FEM
- Loop analysis

How to pump it? Forced? Gravity?

Distance from Rx to H₂, biofuel plant is one of the most important parameters

Heat Transport - Questions

What are the constraints? (T_{H-Rx} , T_{C-H2} , T_{C-bio})

How far does the heat have to go?

Where to take the heat from?

How to transport it?

How to model it? What/where are losses?

Should some of it be stored...

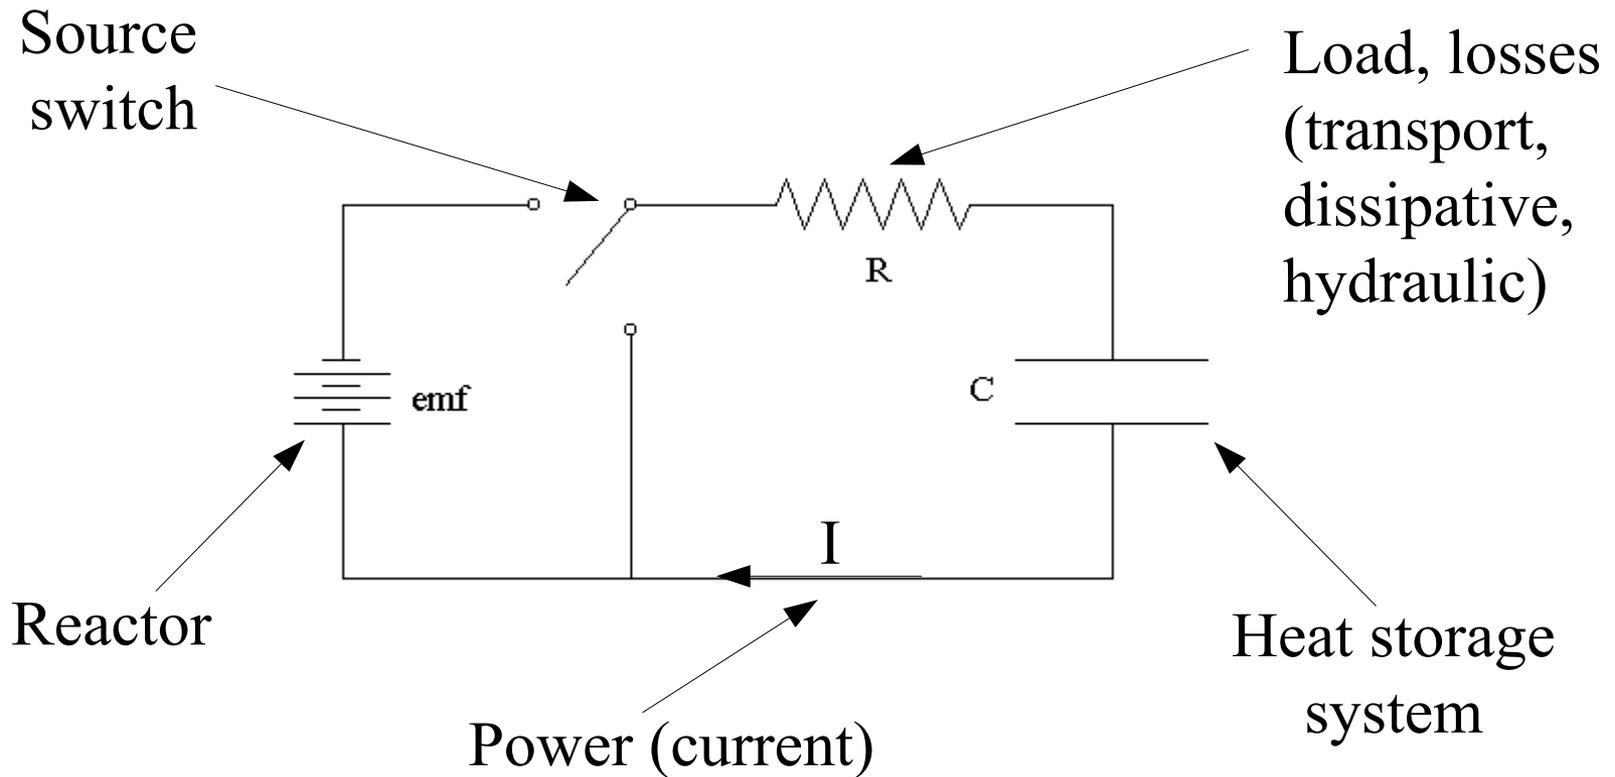

Heat Storage

Heat storage is a way to balance out load instabilities (capacitive effect)

- Store some heat to run turbines and/or product factories during transients
- Can help avoid or delay plants load-dumping or load-following

Must balance benefits gained vs. heat lost by storage

Heat Storage – Electrical Analogy

Heat Storage Technologies

Sensible heat storage

- Simply apply hot fluid to a material, reverse flow when required

Latent heat storage

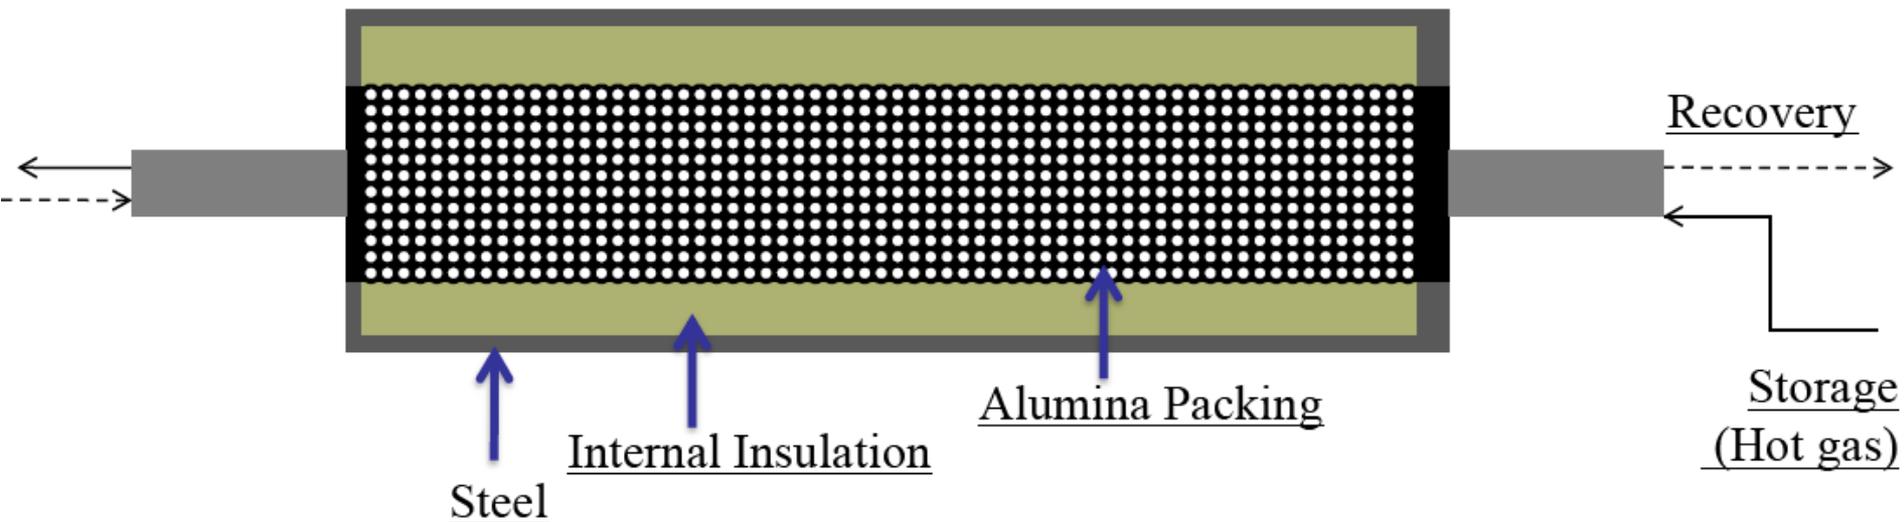

- Uses phase change materials (PCMs)
- Dependent on melting point, heat of fusion

Bond energy storage

- Dependent on reaction temperature, enthalpy

Heat Storage – Sensible Heat

Example: Hot gas on alumina fluidized bed

Heat Storage – Phase Change Materials

Melting temperature and heat of fusion of inorganic substances with potential use as a PCM

Compound	Melting temperature (K)	Heat of fusion (kJ/kg)
H ₂ O	273.2	333
LiClO ₃ ·3H ₂ O	281.3	253
KF·4H ₂ O	291.7	231
Mn(NO ₃) ₂ ·6H ₂ O	299.0	125.9
CaCl ₂ ·6H ₂ O	302.2	190.8
LiNO ₃ ·3H ₂ O	303.2	296
Na ₂ SO ₄ ·10H ₂ O	305.6	254
Zn(NO ₃) ₂ ·6H ₂ O	309.2	246.5
Na ₂ CO ₃ ·10H ₂ O	307.2	146.9
CaBr ₂ ·6H ₂ O	303.2	115.5
Na ₂ HPO ₄ ·12H ₂ O	308.7	265
Na ₂ S ₂ O ₃ ·5H ₂ O	321.2	201
Na(CH ₃ COO)·3H ₂ O	331.2	264
Na ₂ P ₂ O ₇ ·10H ₂ O	343.2	184
Ba(OH) ₂ ·8H ₂ O	351.2	265.7
Mg(NO ₃) ₂ ·6H ₂ O	362.2	162.8
(NH ₄)Al(SO ₄) ₂ ·6H ₂ O	368.2	269
MgCl ₂ ·6H ₂ O	390.2	168.6
NaNO ₃	580.2	172
KNO ₃	606.2	266
KOH	653.2	149.7
MgCl ₂	987.2	452
NaCl	1073.2	492
Na ₂ CO ₃	1127.2	275.7
KF	1130.2	452
K ₂ CO ₃	1170.2	235.8

Heat Storage – Bond Energy

Absorb/Release chemical energy by shifting chemical equilibrium reactions

- Change temperature, pressure
- Examples: hydration, hydriding, ammonia/salt reactions
- Chemical reaction should be reversible

Heat Storage – Questions

What temperature(s) is/are required?

What materials to use?

What capacity to use? (kWh, MWh, Gwh)

How does cost scale with size?

What are loss rates & pathways?

When would it be used, if at all?

Where would it be located?
