Beddington Zero Energy Development

- Bill Dunster Architects
- London, UK 2002

Project aimed to prove market viability of sustainable, high-density development with high quality of life

Dollar value placed on reduced CO₂ emissions in the bidding process allowed project to move forward

Oberlin College, OH.

- Oberlin College Lewis Center
- William McDonough Architects
- Oberlin, Ohio 2001
- John Todd / Ocean Arks International
- Living Machine design

“The Center operates on three fundamental principles of nature — waste equals food, use current solar income, and respect diversity. An integrated approach to natural energy flows will allow the Center to evolve into a net-energy exporter.”
(William McDonough)

Outdoor space use:

Interpretive landscape (80%)
Restored landscape (50%)
Garden—productive (35%)
Wildlife habitat (30%)
Patio/hardscape (20%)
Garden—decorative (15%)
Parking (10%)
Pedestrian/non-motorized vehicle path (5%)
Drives/roadway (5%)

Oberlin College, OH

Educate building management and employees about water conservation

- **Landscape Plantings**

- Landscape with indigenous vegetation

- Landscape with edible plants

- Minimize turf area

- **Managing Stormwater**

- Design a constructed wetland for pollutant removal from stormwater

- **Wastewater and Graywater Recycling**

- Plumb building to accommodate graywater separation

- **Solar energy runs the living machine and passively heats and lights the classroom spaces**

Study for Zuid-oost Industrial Terrain

Natural systems as urban infrastructure

Interconnecting habitats; using natural systems to sustain production of energy, industry, recreation and wildlife

The goal is to open up potential and unforeseen inter-relations between economic and environmental interests, especially in the short term.

Connects innercity areas with the landscapes to the southeast of the city.
Provides a network of east-west and north-south green and blue networks.

Eco-suburbia

- Profit driven – The Woodlands, Houston, Texas
- Ecology driven – Village Homes, Davis, California
- Profit + ecology – Eco-suburbia of the future

Summary

	Number of Systems	Number of Objectives	Influence on Design	Degree of Cooperation Needed
Site	Low	Low	Low	Very Low
New Suburban Neighborhood	Medium	Medium	Medium	Medium
Retrofit Urban Neighborhood	Medium	Medium	Medium	Medium
City	Medium	Medium	Medium	Medium
Region	High	High	High	Very High

Summary

Systems

- Natural systems provide health, recreational, aesthetic, ecological and economic benefits.
- Ecological systems function at a regional scale.

Integration

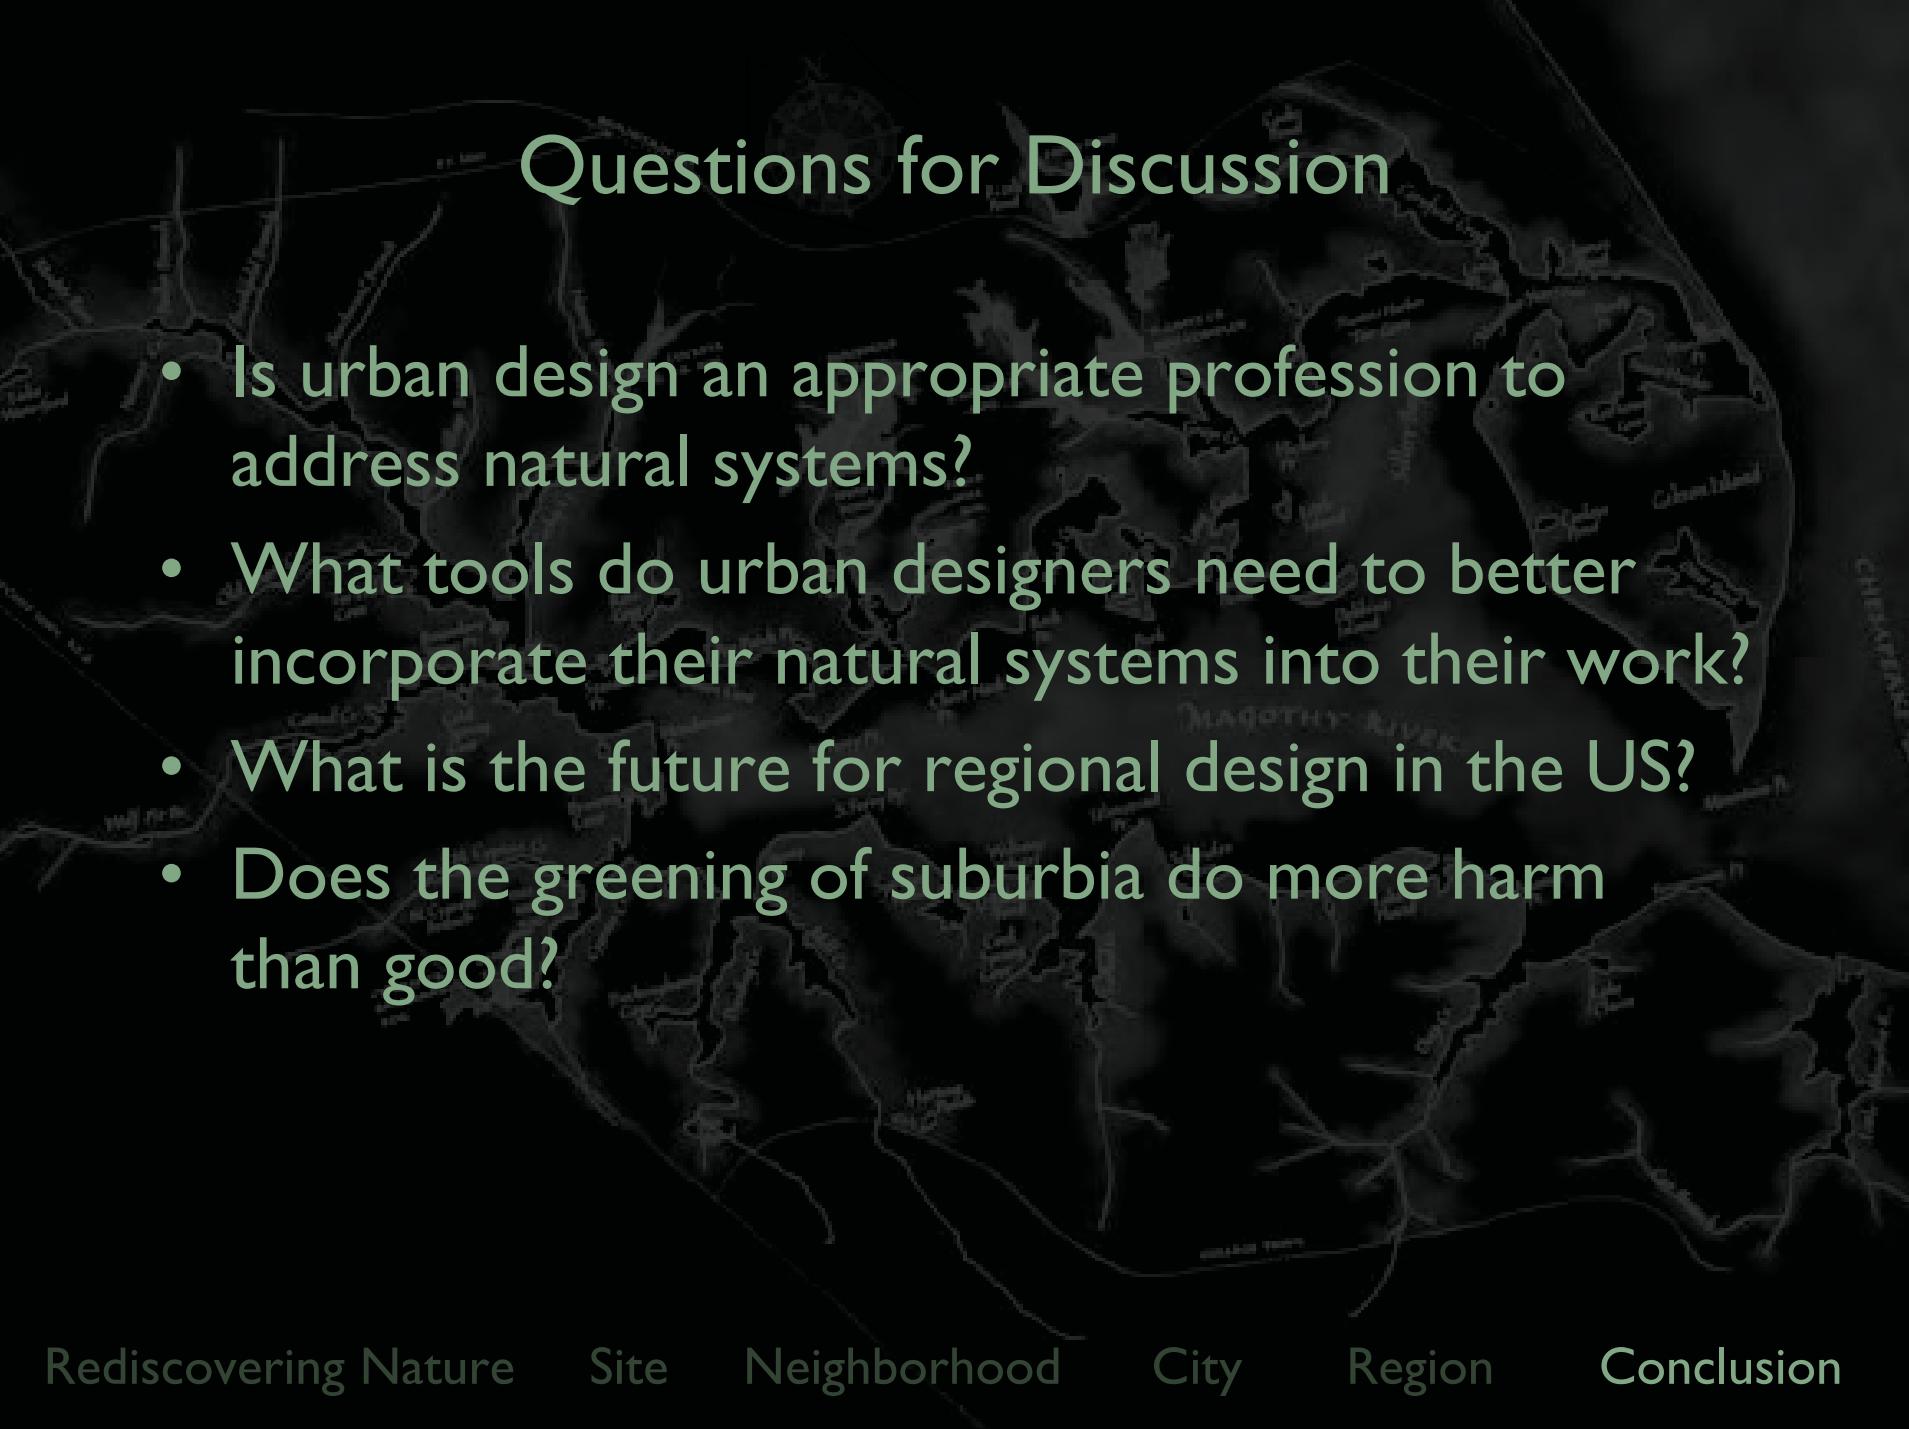

- The highest number of systems are integrated at the site scale.
- Regional projects result from the synergy of meeting these objectives.

Conclusions

- These projects are changing the relationship between individual people and spaces, but ecological systems function on a much grander geographic scale.
- Therefore, urban design as we know it may not be the best way to address natural systems.

Conclusion

- In the current cultural and political paradigm of the U.S., regionalism is weak.
- Smaller scale interventions integrate more natural systems.
- Individual projects in isolation might seem ineffective, but the localized effects can accumulate to create a regional impact.

Questions for Discussion

- Is urban design an appropriate profession to address natural systems?
- What tools do urban designers need to better incorporate their natural systems into their work?
- What is the future for regional design in the US?
- Does the greening of suburbia do more harm than good?
